Motivation			

• "Should any threat to financial stability materialise, specific macro-prudential measures should be implemented by national authorities to deal with local risks, without the need to alter the expansionary stance of monetary policy."

Ignazio Visco, London, 6 May 2015.

• "We are closely monitoring risks to financial stability, but we do not see them materialising for the moment. Should this be the case, macroprudential policy not monetary policy would be the tool of choice to address these risks."

Main results			

- The increase in households borrowing in one region during the APP can be further magnified by
 - a high loan-to-value (LTV) ratio,
 - irrational, overly optimistic expectations on real estate prices.
- Region-specific macroprudential measures can stabilize private sector borrowing, with limited negative effects on economic activity.

 Scenario 2: APP + Home-specific non-fundamental
 expectational shock

• The non-fundamental shock is calibrated to get, on top of the APP-induced increase in Home real estate price, an additional increase equal to around 5% of the baseline (steady- state) level on average in the first year.

• Such value is line with evidence provided by Hartmann (2015): average increase in the overvalued component of housing prices of around 5% per year over the 2002-2007 run-up in the EA.

 Scenario 3: APP, Home expectation shock and

 macroprudential policy

• The Home macroprudential authority can modify LTV ratio to limit the increase in borrowing, according to the feedback rule

$$m_t = \rho_m m_{t-1} + \rho_{B_D} \left(\frac{B_{D,t}^S}{GDP_t} - \frac{B_{D,t-1}^S}{GDP_{t-1}} \right)$$

• We calibrate the parameters in the rule to obtain a situation in which, under the combination of APP and non-fundamental shock, an increase in household debt is in line with the one observed in the benchmark scenario.

Conclusions			

 During APP and FG implementation, region-specific macroprudential measures can stabilize excessive private sector borrowing (i.e. not reflecting fundamentals), with limited negative effects on regional economic activity and almost no impact on inflation.

 Possible synergies between non-standard monetary and macroprudential policies in a monetary union: monetary policy necessarily focuses on the union-wide economic conditions, region-specific macroprudential policies pursue financial stability at regional level.
