EDITORIAL

At its meeting on 5 October 2006, the Governing Council decided to increase the minimum bid rate of the main refinancing operations of the Eurosystem by 25 basis points to 3.25%. The interest rates on the marginal lending facility and the deposit facility were also increased by 25 basis points to 4.25% and 2.25% respectively. The decision to raise the key ECB interest rates reflects the upside risks to price stability over the medium term that the Governing Council has identified on the basis of its regular economic and monetary analyses. The decision will contribute to ensuring that medium to longer-term inflation expectations in the euro area remain solidly anchored at levels consistent with price stability. Such anchoring is a prerequisite for monetary policy to make an ongoing contribution towards supporting sustainable economic growth and job creation in the euro area. Also after this increase, the key ECB interest rates remain at low levels, money and credit growth remain strong, and liquidity in the euro area is ample by all plausible measures. The ECB's monetary policy therefore continues to be accommodative. If the Governing Council's assumptions and baseline scenario are confirmed, it will remain warranted to further withdraw monetary accommodation. The Governing Council will therefore continue to monitor very closely all developments so as to ensure price stability over the medium and longer term.

Starting with the economic analysis, the quarter-on-quarter growth rate of real GDP in the euro area for the second quarter of 2006 was confirmed at 0.9%. Moreover, since the previous meeting of the Governing Council, on 31 August 2006, Eurostat has revised upwards the growth data for the two preceding quarters, thereby confirming that a significant acceleration in economic expansion has taken place over the past few quarters. On the basis of the revised data, economic activity has been growing at a quarterly rate of 0.7% on average over the last four quarters, the unemployment rate has been on a falling trend, employment growth has recovered and employment expectations overall have remained favourable. All in all, the

economic recovery now appears somewhat stronger than on the basis of earlier data. It has become more broadly based and is mainly supported by domestic demand. The available information on activity in the third quarter – coming from various confidence surveys and indicator-based estimates – continues to support the assessment that economic activity will grow robustly, while possibly moderating somewhat.

Looking ahead to the remainder of 2006 and 2007, the conditions remain in place for the euro area economy to grow at solid rates around potential, with some volatility in the quarterly growth rates likely to emerge around the turn of the year. Global economic activity has become more balanced across regions and is still robust, thereby providing ongoing support for euro area exports. Investment is expected to remain strong, benefiting from an extended period of very favourable financing conditions, balance sheet restructuring, accumulated and ongoing strong earnings, and gains in business efficiency. Consumption growth in the euro area should also strengthen further over time, in line with developments in real disposable income, as employment conditions continue to improve.

Risks to the outlook for economic growth are broadly balanced over the shorter term, although the recent fall in oil prices – if it were to prove lasting – has the potential to lead to somewhat stronger demand and output growth than embodied in the Governing Council's baseline scenario for activity in the coming quarters. Over the longer term, risks to growth lie on balance on the downside, and relate mainly to the possibility of a renewed increase in oil prices, fears of a rise in protectionist pressures, especially after the suspension of the Doha round of trade talks, and possible disorderly developments owing to global imbalances.

As regards price developments, according to Eurostat's flash estimate, annual HICP inflation fell to 1.8% in September 2006, from 2.3% in August. Although no detailed breakdown is available as yet, this relatively sharp decline seems to be the combined result of favourable

base effects, given in particular the strong rise in oil prices a year ago, and the recent significant fall in oil prices. While the outlook for energy prices is uncertain, on the basis of current energy prices and the higher quotations on futures markets, overall inflation rates are likely to increase again towards the end of the year and in early 2007. As a consequence, the Governing Council expects a considerable degree of short-term volatility in the annual HICP inflation rate, while the overall inflation rate will remain elevated at levels above 2% on average in 2006 and is likely to remain so in 2007.

In addition, risks to the outlook for price developments remain clearly on the upside. They continue to include a stronger pass-through of past oil price rises into consumer prices than currently anticipated and additional increases in administered prices and indirect taxes beyond those announced thus far. Furthermore, renewed increases in oil prices cannot be excluded. More fundamentally, given the favourable momentum of real GDP growth observed over the past few quarters and the positive signs from labour markets, stronger than currently expected wage developments pose substantial upward risks to price stability. Against this background, it is crucial that the social partners continue to meet their responsibilities, in particular in the context of a more favourable environment for economic activity and employment.

The monetary analysis continues to point to upside risks to price stability at medium to longer horizons. Annual M3 growth rose again to 8.2% in August and, more generally, the rate of monetary and credit expansion remains rapid, reflecting the still low level of interest rates in the euro area. In particular, loans to the private sector continue to grow at double-digit rates on an annual basis, remaining broadly based across the household and corporate sectors. Taking the appropriate medium-term perspective, these developments remain consistent with the persistent upward trend in the underlying rate of monetary expansion, identified by the ECB's

monetary analysis since mid-2004. Moreover, following several years of robust monetary growth, the liquidity situation in the euro area is ample by all plausible measures. Continued strong monetary and credit growth in an environment of still ample liquidity, as a result of the persistently high rate of monetary expansion over the past few years, point to upside risks to price stability over the medium to longer term. Monetary developments therefore require careful monitoring, particularly against the background of improved economic conditions and strong property market developments in many parts of the euro area.

To sum up, annual inflation rates are projected to remain elevated in 2006 and 2007, with risks to this outlook remaining clearly on the upside. Given the ongoing dynamism of monetary and credit growth in an environment of ample liquidity, a cross-check of the outcome of the economic analysis with that of the monetary analysis supports the assessment that upside risks to price stability prevail over the medium term. It is essential that inflation expectations remain firmly anchored at levels consistent with price stability. If the Governing Council's assumptions and baseline scenario are confirmed, it will remain warranted to further withdraw monetary accommodation. The Governing Council will therefore continue to monitor very closely all developments so as to ensure price stability over the medium and longer term.

As regards fiscal policy, euro area countries are now in the process of finalising their 2007 budgets and preparing their next stability programme updates. In the current favourable economic environment, it is essential that adequate headway be made towards sound public finances, implying that budget targets for 2007 should generally be more ambitious than in previous programmes. Countries in excessive deficit need to remain fully committed to bringing their deficits to below 3% within the agreed deadline via adequate and credible structural consolidation. Other countries need to make clear progress towards their medium-

term objectives in line with the requirements of the Stability and Growth Pact. In all cases, any revenue windfalls from stronger than expected growth should be used to speed up deficit reduction or to increase surpluses. Pro-cyclical policies should be avoided and expenditure restraint is of particular importance, also given the high spending ratios and taxes as compared with many other industrialised countries. Experience has shown that expenditure reform is key to successful consolidation, and consolidation is essential for reducing overall public debt and for making public finances less vulnerable to the impact of ageing populations.

Fiscal consolidation is likely to be most successful when coupled with comprehensive structural reforms. These are urgently needed to help to cushion the unfavourable economic effects of the projected demographic change in the euro area. The decline in the working age population will place further pressure on pension and health care systems, and may have wide-ranging economic consequences. In order to support the potential economic growth of the euro area, to foster macroeconomic flexibility and dynamism, and to safeguard the future standard of living of our citizens, labour and product market reforms are urgently needed. This will increase labour market participation and employment and strengthen innovation and the other forces driving productivity and economic growth. The ECB will play its part by continuing to maintain price stability over the medium term.

This issue of the Monthly Bulletin contains two articles. The first article discusses the possible economic consequences and monetary policy implications of projected demographic trends in the euro area, underlining the critical need for structural reforms to better cope with the adverse effects of ageing populations on the economy. The second article sets out the main features of the integrated financial and non-financial accounts for the institutional sectors

of the euro area, which were published for the first time in May 2006, with a special focus on some more recent results for households and non-financial corporations.

ECONOMIC AND MONETARY DEVELOPMENTS

I THE EXTERNAL ENVIRONMENT OF THE EURO AREA

The expansion of the global economy moderated in the second quarter of 2006, with real GDP growth slowing in both the United States and Japan compared with the first quarter. Although recent leading indicators suggest a further moderation, world growth is expected to remain fairly robust and above historical averages for the remainder of the year. Global consumer price inflation continued to broadly reflect developments in energy prices, suggesting a possible moderation in global inflationary pressures in the near term. Risks to the global economic outlook continue to be related to oil market developments, a disorderly unwinding of global economic imbalances and increased protectionist pressures.

I.1 DEVELOPMENTS IN THE WORLD ECONOMY

The expansion of the global economy moderated in the second quarter of 2006, with real GDP figures recording a slowdown in both the United States and Japan compared with the first quarter. Industrial production in the OECD countries (excluding the euro area) continued to grow at a rather robust pace in June (see Chart 1), suggesting that the external environment of the euro area remains favourable.

With regard to price developments, annual consumer price inflation continued to be influenced to a large extent by energy price changes. For the OECD countries, the annual rate of change of the CPI decreased slightly to 3.0% in August, while, excluding food and energy, it edged up by 0.1 percentage point, to 2.2%. The recent fall in oil prices, and survey evidence indicating some decreases in input prices, suggest a possible moderation in global inflationary pressures in the near term.

UNITED STATES

In the United States, real GDP growth moderated to 0.6% in the second quarter of 2006 on a quarter-on-quarter basis. A downturn in household spending on durable goods constituted the prime factor behind the weakening of real GDP growth, although this was partly offset by stronger household demand for services. The decline in growth in the second quarter also reflected a drop in fixed investment, especially residential investment, indicating a slowdown in the US housing market, while the contribution of net exports turned slightly positive.

The expansion of the US economy is expected to be less vigorous in the second half of the year also, given the moderation in household spending and residential investment as a result of the slowing of house price appreciation and falling activity in the housing market. Increasing wage income on account of tight labour market conditions, as well as resilient corporate investment spending, may partly offset the negative impact of the housing market slowdown on aggregate demand.

Chart 1 Industrial production in the OECD countries

(annual percentage changes; monthly data)

Sources: OECD and ECB calculations.
Note: Last observation refers to July 2006 except for the OECD excluding the euro area (June 2006).

In the second quarter the US current account deficit remained unchanged at about 6.6% of GDP. Although the trade balance deficit continued to be the major factor behind this high deficit, it is notable that the investment income balance showed a deficit for the third consecutive quarter (amounting to USD 4.1 billion in the second quarter). This contrasts with the situation prevailing in previous years when the United States recorded a positive net investment income balance due to the higher rate of return on US assets abroad than on foreign assets in the United States, in spite of the rapid accumulation of foreign debt.

As for price developments, inflationary pressures seem to have eased somewhat in recent months on account of both smaller increases in energy prices and a more broad-based moderation in non-energy prices. Price pressures, which are being driven by high levels of resource utilisation, should moderate further given the outlook of slower economic growth, contained inflation expectations and the recent fall in commodity prices. However, recent labour cost data suggest an increased risk of inflationary pressures stemming from the labour market.

On 20 September 2006 the Federal Open Market Committee decided to keep its target for the federal funds rate unchanged at 5.25%.

JAPAN

In Japan, according to the second preliminary data estimate by the Cabinet Office, quarterly real GDP grew by 0.2% in the second quarter. Despite the moderation in GDP growth compared with the first quarter, economic activity is expected to accelerate in the second half of the year, sustained by strong private investment and a pick-up in private consumption.

As regards price developments, consumer prices continued to rise at a moderate pace. In August the CPI excluding fresh food posted its third consecutive monthly increase, rising by 0.3% on an annual basis after a 0.2% rise in the previous month. Producer prices increased much more rapidly, rising by 3.4% on an annual basis in both July and August – the fastest rate of increase since 1981. Finally, in the second quarter the GDP deflator fell by 0.8% year on year, after recording a 1.2% fall in the first quarter. At its meeting on 7-8 September 2006 the Bank of Japan decided, by a unanimous vote, to leave the target for the uncollateralised overnight call rate unchanged at 0.25%.

Chart 2 Main developments in major industrialised economies

Sources: National data, BIS, Eurostat and ECB calculations.
1) Eurostat data are used for the euro area and the United Kingdom; national data are used for the United States and Japan. GDP figures have been seasonally adjusted.
2) HICP for the euro area and the United Kingdom; CPI for the United States and Japan.

UNITED KINGDOM

In the United Kingdom, economic activity continued to grow at a steady pace, as indicated by a quarterly rate of GDP growth of 0.7% in both the first and second quarters. Although retail sales data for July and August may point to some moderation in household consumption growth in the third quarter of 2006, output in the manufacturing sector continued to expand at a robust pace over the same period, partly due to strong foreign demand. Business survey data also suggest some firming of export growth for the remainder of the year. Although in recent months unemployment has continued to rise and growth in average earnings has remained contained, growth momentum is expected to be sustained in the second half of the year also.

Annual HICP inflation hovered around 2.5% between June and August, reflecting strong growth in energy and food prices. The pace of house price increases continued to be strong in historical terms. At its meeting on 4-5 October, the Bank of England's Monetary Policy Committee decided to leave the repo rate unchanged at 4.75%.

OTHER EUROPEAN COUNTRIES

In most other EU countries outside the euro area, second quarter figures for 2006 confirm that output growth continued to be strong, with domestic demand being the main driver. In many new EU Member States, economic activity has also been supported by strong export growth, which was in turn largely related to past foreign direct investment inflows. Annual HICP inflation rose in most countries, mainly on account of an increase in the non-energy component of the HICP. In September several national central banks decided to increase their key policy rates, owing mainly to concerns over rising inflationary pressures.

In Denmark, the quarterly rate of real GDP growth picked up strongly, to 1.9%, in the second quarter, while in Sweden it remained high, at 1.4% – unchanged from the previous quarter. In both countries, economic activity appeared to be sustained by rather robust domestic demand and, in the case of Denmark, also by net exports. Overall, the outlook for growth remains steady in both countries. Annual HICP inflation eased further in August in both countries, declining to 1.9% in Denmark and 1.6% in Sweden. On 5 October, Danmarks Nationalbank raised its benchmark rate by 25 basis points.

In the Czech Republic, Hungary and Poland, output growth continued to be robust, although some degree of moderation was observed in the second quarter compared with the first. Quarterly GDP growth declined to 1.2% in the Czech Republic, to 0.9% in Hungary and to 1.1% in Poland. GDP growth in the Czech Republic and Poland was mainly driven by domestic demand, while in Hungary it was driven by net exports. Indicators suggest that economic growth is likely to remain strong in the Czech Republic and Poland, while it is expected to decelerate in Hungary as a result of fiscal stabilisation measures. Annual HICP inflation increased in August in all three countries, most notably in Hungary where energy price inflation also picked up strongly due to a gas price increase. HICP inflation was 2.6% in the Czech Republic, 4.7% in Hungary and 1.7% in Poland in August. In all three countries, annual HICP inflation excluding energy has risen gradually this year. Česká národní banka and Magyar Nemzeti Bank increased their key reference rates by 25 and 50 basis points respectively in September.

Economic activity remained robust in the other EU Member States, particularly the Baltic States and Slovakia. On 26 September Národná banka Slovenska raised its main policy rate by 25 basis points.

EMERGING ASIA

In emerging Asia, while economic activity grew at a robust pace in the first half of the year, some degree of moderation might be expected in the future. In particular, recent indicators suggest that business activity softened somewhat in July and August. Domestic activity appears to have slowed in most major economies in the region, whereas exports maintained the strong momentum of the first half of the year – and even accelerated in some countries. Inflation was little changed in August, compared with July.

In China, following a strong performance in the first half of 2006, there are signs that the economy may be beginning to react to the interest rate hikes and the other tightening measures introduced in the first half of the year. In particular, industrial production slowed to about 16% year on year in August, from 19.5% in July. However, retail sales growth remained broadly stable in August and the trade surplus rose to a new monthly record on the back of strong exports, with the cumulated surplus for the first eight months of the year reaching almost the same level as for the whole of 2005. Official reserves rose to USD 954 billion in July. As regards price developments, inflationary pressures increased slightly in August, with annual CPI inflation rising to 1.3%, from 1% in July, mainly owing to increases in food and housing prices.

Overall, economic prospects remain favourable for emerging Asia, underpinned by steady growth in domestic demand and robust momentum of foreign trade. Steady, albeit moderating, growth in China is likely to support exports and activity in the region. But excess capacity in some sectors of China's economy remains the main downside risk to this outlook.

LATIN AMERICA

Economic growth continued to be robust in the region. In Mexico, the vigorous economic growth achieved in the second quarter persisted, as industrial production grew at an annual rate of 6% in July. At the same time, annual inflation picked up in the course of the summer, reaching 3.5% in August, mainly because of higher administrative prices. In Argentina, GDP expanded by an annual rate of close to 8% in the second quarter, driven primarily by export demand and the construction sector. However, annual inflation remained high at almost 11% in August. By contrast, Brazil's GDP figures pointed to a slowdown in economic activity, with annual GDP expanding by 1.2% in the second quarter of 2006 and inflation falling to less than 4% in August. Looking ahead, economic prospects for the region are positive, supported by strong domestic demand and exports.

1.2 COMMODITY MARKETS

Oil prices declined substantially after reaching a new historical high at the beginning of August. On 4 October Brent crude oil prices stood at USD 59.3 per barrel, which is approximately 24% below the peak in early August and only around 3% above the level recorded at the beginning of the year. The recent oil price slide has been mainly prompted by the comfortable level of US petrol inventories, a relatively mild tropical storm season in the Gulf of Mexico and an improvement in the geopolitical climate, with growing expectations among market participants that the United Nations Security Council will not impose sanctions on Iran over its nuclear programme. The downward revision of expected oil demand growth for 2006 and 2007 by the International Energy Agency, which was mainly due to revisions of US and Mexican demand, also exerted some downward pressure on prices. Meanwhile, OPEC decided at its latest meeting in September to maintain current production levels, while signalling that stockpiling and an uncertain global

economic picture may lead to a decision to cut production in coming months. Market participants continue to expect prices to remain at elevated levels by historical standards, with the December 2008 Brent crude oil futures contract currently trading at USD 66.4. Moreover, given the limited spare capacity throughout the supply chain, oil prices are likely to remain highly sensitive to unanticipated changes in the balance of supply and demand and in the geopolitical environment.

Prices of non-energy commodities also declined at the beginning of September, but started to pick up again towards the end of the month. Expressed in US dollar terms, total non-energy commodity prices were approximately 31% higher in September compared with a year earlier, supported by an increase in both industrial raw materials and food prices.

Chart 3 Main developments in commodity markets

1.3 OUTLOOK FOR THE EXTERNAL ENVIRONMENT

Overall, the outlook for the external environment, and thus for foreign demand for euro area goods and services, remains favourable. The latest composite leading indicators suggest, however, that in most developed OECD countries the rate of economic expansion may be subject to some degree of moderation. The latest data for major non-OECD economies suggest a slight weakening of the outlook for China while the expansion in India, Russia and Brazil is likely to remain strong. Despite this anticipated moderation, world growth is expected to remain fairly robust and above historical averages for the remainder of the year.

The risks to the outlook remain tilted somewhat to the downside, although the recent decreases in oil prices may – at least temporarily – help to reduce one of the main sources of concern for the global economy. Risks related to a disorderly unwinding of global economic imbalances and to increased protectionist pressures also persist.

2 MONETARY AND FINANCIAL DEVELOPMENTS

2.1 MONEY AND MFI CREDIT

In August 2006 the annual growth rate of M3 remained strong, reflecting the continued low level of interest rates and the strengthening of economic activity in the euro area. On the counterparts side, the impact of these factors is particularly visible in the continued vigorous growth of loans to the private sector. At the same time, the latest data provide further evidence that recent rises in key ECB interest rates have influenced monetary developments by stimulating substitution within M3 into more highly remunerated components and by increasing the attractiveness of monetary assets relative to that of longer-term financial assets. Overall, money and credit developments continue to point to upside risks to price stability at medium to longer-term horizons, particularly in an environment of improved economic sentiment and activity.

THE BROAD MONETARY AGGREGATE M3

In August 2006 the annual growth rate of the broad monetary aggregate M3 increased to 8.2%, having previously declined from 8.8% in May 2006 to 7.8% in July 2006. The annualised six-month rate of growth rose to 9.6% in August, from 8.5% in the previous month (see Chart 4). This renewed strengthening in monetary dynamics reflects a very strong seasonally adjusted month-on-month growth rate in August, following a series of declining month-on-month growth rates observed since March 2006.

The latest monetary data support the view that the ongoing high rate of M3 growth results largely from the low level of interest rates and the strengthening of economic activity in the euro area. This interpretation is in particular supported by the ongoing strength of the annual growth of loans to the private sector. The latest data also provide further evidence that the recent rise in key ECB interest rates has begun to affect monetary developments via shifts within the broad monetary aggregate M3, such as shifts from overnight deposits to more highly remunerated short-term deposits. Furthermore, in an environment characterised by expectations of increases in short-term interest rates, the strong demand for certain monetary assets may also reflect the increasing attractiveness of these assets relative to the yields on longer-term financial assets (i.e. speculative demand for money).

Overall, money and credit growth remain at a high level, having followed a sustained upward trend since mid-2004. Continued strong money and credit growth in the context of ample liquidity points to upside risks to price stability over the medium to longer term, particularly in an environment of improved economic sentiment and activity.

Chart 4 M3 growth and the reference value

(percentage changes; adjusted for seasonal and calendar effects)

— M3 (three-month centred moving average of the annual growth rate)
••• M3 (annual growth rate)
- - - M3 (annualised six-month growth rate)
— reference value (4½%)

Source: ECB.

MAIN COMPONENTS OF M3

The August increase in annual M3 growth reflects the substantially higher annual growth rates both of short-term deposits other than overnight deposits (M2 - M1) and of marketable instruments (see Table 1). At the same time, on account of the lower growth rates of both of its components – currency in circulation and overnight deposits – the annual growth rate of M1 declined from 7.4% in July to 7.2% in August.

The annual rate of growth of short-term deposits other than overnight deposits increased to 9.8% in August, from 9.2% in the previous month, as a result of a strengthening in the annual growth rate of deposits with an agreed maturity of up to two years (i.e. time deposits), which more than offset the decline in the annual growth rate of deposits redeemable at notice of up to three months (i.e. savings deposits). The strong demand for short-term time deposits is likely to be related to the increasing divergence between the interest rate offered on these deposits and that available on other short-term instruments in the context of recent interest rate increases.

In August the annual growth rate of marketable instruments included in M3 increased to 7.3%, from 5.3% in July. This strengthening was predominantly accounted for by a strong rise in the annual growth rate of debt securities with a maturity of up to two years. A similarly strong demand for short-term debt securities was observed during the period of interest rate increases in 2000. Some short-term debt securities have the attractive feature of allowing investors to benefit from an unexpected rise in interest rates before maturity. In the context of the recent increases in short-term interest rates and expectations of further increases, the continued strong demand for short-term debt securities may thus reflect some speculative demand for money.

The annual growth rate of short-term deposits and repurchase agreements held with MFIs – which represent the broadest aggregation of M3 components for which information is available by holding sector – increased in August. This increase mainly reflects a rise in the contributions of

households and, to a lesser extent, non-financial corporations. The contribution of non-monetary financial intermediaries (except insurance corporations and pension funds), which in past months had accounted for a large part of the changes in the growth of overall short-term deposits and repurchase agreements, remained broadly unchanged in August.

MAIN COUNTERPARTS OF M3

On the counterparts side, the annual growth rate of MFI loans to the private sector increased to 11.3% in August, from 11.1% in July. The ongoing strong demand for loans reflects improved economic conditions and the continued low level of interest rates. At the same time, the strengthening in aggregate loan dynamics in August concealed different developments for households and non-financial corporations.

The annual rate of growth of loans to households declined slightly further in August, to 9.2%, from 9.4% in July. Despite the moderation seen in recent months, growth in loans to households remained strong. The overwhelming majority of the ongoing strong lending activity to households continued to be explained by borrowing for house purchases, which grew at an annual rate of 11.1% in August, after standing at 11.4% in the previous month (see Table 2). Strong borrowing for house purchases reflects the continued low level of mortgage lending rates prevailing in the euro area as a whole and the robust housing market dynamics observed in many regions. The annual growth rate of consumer credit declined to 8.3% in August – from 8.6% in July, which had been the highest level observed since late 1999.

By contrast with loans to households, the annual growth rate of MFI loans to non-financial corporations rose further in August, reaching 12.0% and thus continuing the upward trend observed since early 2004. This further strengthening in the annual growth rate was mainly attributable to loans with maturities of over one year. In addition to the improved economic conditions and the continued low level of interest rates, the difference between the cost of market-based finance and MFI lending rates increased, and may therefore have supported demand for loans from the

3) The definitions of consumer credit and lending for house purchase are not fully consistent across the euro area.

Chart 5 Counterparts of M3

(annual flows; EUR billions; adjusted for seasonal and calendar effects)

Source: ECB.

Notes: M3 is shown for reference only ($M3 = 1+2+3-4+5$). Longer-term financial liabilities (excluding capital and reserves) are shown with an inverted sign, since they are liabilities of the MFI sector.

corporate sector at the expense of other forms of finance such as debt securities issuance. In addition, non-financial corporations may have expanded their borrowing to fund financial investment.

Looking at developments in overall MFI credit granted to euro area residents, the annual growth rate remained broadly unchanged in August compared with the previous month. This overall stability conceals a further moderation in the annual growth rate of credit granted to government and a strengthening in the growth of credit granted to the private sector. As the latter reflects not only stronger lending to the private sector, but also MFIs' stronger acquisition of securities issued by the private sector, this implies an increase in the exposure of MFIs to the private sector.

Among the other counterparts of M3, the annual growth rate of MFI longer-term financial liabilities (excluding capital and reserves) was 8.6% in August, having stood at 8.7% in July, with short-term dynamics as measured by the annualised six-month rate of growth remaining

strong. Looking at the components of these liabilities indicates that developments were broadly based across longer-term debt securities and deposits. Overall, this suggests a continued inclination on the part of euro area residents to invest in longer-term assets denominated in euro.

In the 12 months to August, the net external asset position of MFIs decreased by €5 billion, after increasing by €10 billion in the year to end-July (see Chart 5). On a monthly basis, an outflow of €20 billion was recorded in August – after an inflow of €5 billion in the previous month. This latest development in the external contribution to euro area monetary developments had a dampening impact on M3 growth.

Summing up the information from the counterparts, the low level of interest rates and the improved economic conditions continued to be the main driving force behind the strength of MFI loans to the private sector. At the same time, the external contribution to the annual growth rate of M3 was marginal in August, as reflected in the broadly balanced net external asset position of the MFI sector. This confirms the assessment that the strength of the monetary expansion is currently being underpinned mainly by domestic forces. With regard to the data for August, it should be noted that a considerable part of the strengthening of M3 growth reflects changes in “other counterparts”, which include residual items and can, at times, be volatile. Caution is therefore warranted when interpreting the latest monthly figures.

2.2 SECURITIES ISSUANCE

In July 2006 the annual growth rate of debt securities issued by euro area residents continued to be robust. Underlying this development was the relatively strong annual growth of debt securities issued by non-monetary financial corporations and, to a lesser extent, MFIs. At the same time, the annual growth rate of debt securities issued by non-financial corporations remained at the relatively low levels observed in previous months. The annual rate of growth of quoted shares issued by euro area residents rose slightly, but remained at a subdued level.

DEBT SECURITIES

The annual growth rate of debt securities issued by euro area residents increased to 7.0% in July 2006, from 6.6% in June (see Table 3). The annual growth rate of variable-rate long-term debt securities, standing at 15.4% in July, continued to strongly outpace the annual growth rate of fixed-rate debt securities (4.3%). Looking back over a somewhat longer period, the annual growth rate of variable-rate long-term debt securities has, however, fallen from its last peak of 22.1% in June 2005. Over the same period, the annual growth rate of short-term debt securities has tended to increase from a very low level, and stood at 5.2% in July 2006. Overall, these developments indicate that short-term issues and long-term issues at variable rates, taken together, have somewhat increased their share in net issuance of debt securities, and stood at 16% and 37% respectively between January and July 2006, with the share of long-term issues at fixed rates standing at 41% over the same period.

Looking at issuance activity by sector, the annual growth rate of debt securities issued by non-financial corporations decreased slightly to 4.3% in July (see Chart 6). The relatively modest growth observed over recent periods – in particular compared with the robust growth in MFI loans to non-financial corporations – may in part be related to an increased supply of bank loans inducing, for example, a shift in the financing of mergers and acquisition activity towards syndicated bank loans rather than through the issuance of corporate bonds. In July the annual rate

Table 3 Securities issued by euro area residents

of growth of short-term debt securities issuance by non-financial corporations was -3.1%, while for long-term debt securities it decreased to 5.8%.

In July 2006 the annual growth rate of debt securities issued by MFIs increased slightly to 8.3%, from 8.1% in June. This development was mainly the result of an increase in the annual growth rate of long-term debt securities to 7.7% in July (from 7.2% in June). Looking back over a longer period, growth in fixed-rate issues has tended to strengthen somewhat since around mid-2005, while the dynamics of floating-rate issuance have weakened. However, the annual growth rate of fixed-rate issues remains below that of floating-rate issues. The annual growth rate of short-term debt securities, while continuing to decrease, remained at a relatively high level of 13.0% in July 2006. Overall, the strong growth of debt issuance by the MFI sector is likely to reflect strong demand for funds as a result of the robust growth in MFI loans to households and non-financial corporations.

In July 2006 the annual growth rate of debt securities issued by non-monetary financial corporations remained very strong at 26.7%. This high level of growth is to a large extent related to non-financial corporations, MFIs and other intermediaries securing external debt financing indirectly through financial subsidiaries and special purpose vehicles. In this respect, the high level of issuance activity by non-monetary financial corporations partly reflects issuance activity by the MFI sector, which is increasingly using those corporations to securitise part of its loan portfolio by passing on certain loans to the financial markets in the form of marketable debt securities.

The annual growth rate of debt securities issued by the general government sector, while increasing slightly to 2.7% in July 2006 (from 2.4% in June), appears to be continuing its downward trend and remains relatively close to the historically low levels observed at the beginning of 2001. These movements essentially reflect developments in the annual growth rate of debt securities issued by the central government sector (2.2% in July). The issuance activity of the other general government sector, although decreasing somewhat in July, continues to grow significantly faster, at an annual rate of 11.6% in July 2006.

QUOTED SHARES

The annual growth rate of quoted shares issued by euro area residents increased slightly to 1.3% in July, from 1.1% in June. In terms of sectoral issuance, the annual growth rate of quoted shares issued by non-financial corporations, which account for around three-quarters of outstanding quoted shares, remained broadly unchanged from the previous month, at 1.1% in July (see Chart 7). The annual growth rate of quoted shares issued by MFIs increased somewhat to 1.9% in July, from 1.5% in June.

2.3 MONEY MARKET INTEREST RATES

In September 2006 money market interest rates increased across the whole maturity spectrum, with the largest increases being observed for shorter-term rates. As a result, the slope of the money market yield curve flattened over the month.

Over the period from the end of August to 4 October 2006, money market interest rates rose at all maturities, with the largest increase observed at the short end of the maturity spectrum. Compared with end-August, one, three, six and twelve-month interest rates increased by 18, 15, 11 and 8 basis points respectively to stand at 3.32%, 3.45%, 3.60% and 3.76% on 4 October. As a result, the slope of the money market yield curve flattened over the review period. The spread between the twelve-month and the one-month EURIBOR declined from 53 basis points at the end of August to 43 basis points on 4 October.

The interest rates implied by the prices of three-month EURIBOR futures contracts maturing in December 2006, March 2007 and June 2007 stood at 3.68%, 3.78% and 3.79% respectively on 4 October. Compared with the levels observed at the end of August, these rates increased by 4, 6 and 6 basis points respectively.

After remaining at 3.07% during the first two weeks of the reserve maintenance period starting on 9 August, the EONIA declined thereafter. During the last week of that maintenance period, amid loose liquidity conditions, the EONIA stood at levels very close to the minimum bid rate, even falling below it on the penultimate day. On the last day of the maintenance period the EONIA rose to 3.04% following the absorption by the ECB of an estimated €11.5 billion of excess liquidity via a fine-tuning operation, which restored broadly neutral liquidity conditions. The EONIA rose to 3.06% at the beginning of the maintenance period starting on 6 September, but started to decline at the beginning of the second week of that period and reached a level only 1 basis point above the minimum bid rate on 22 September. Given the results achieved in reducing the spread between the EONIA and the minimum bid rate over the past few months, and in order to reduce the risk of underbidding, which could occur if interest rates at the shortest end of the money market yield curve reach very low levels, the ECB decided to end its policy of allotting €1 billion more than the benchmark amount in the Eurosystem's main refinancing operations and allotted the benchmark

Sources: ECB and Reuters.

amount in the weekly operation conducted on 26 September. In response, the EONIA rose in the following days to reach 3.18% on 4 October, owing to expectations that the maintenance period would end with tight liquidity conditions.

The marginal and weighted average rates in the Eurosystem's main refinancing operations declined over the course of the maintenance period starting on 6 September, falling from 3.04% and 3.05% respectively in the first main refinancing operation to 3.00% and 3.03% in the operation conducted on 26 September. In the main refinancing operation conducted on 2 October, i.e. the last of the maintenance period, the two tender rates rose to 3.02% and 3.04% respectively.

In the Eurosystem's longer-term refinancing operation conducted on 27 September, the marginal and weighted average rates stood at 3.30% and 3.32% respectively. Those tender rates were, respectively, 8 and 6 basis points lower than the three-month EURIBOR prevailing on that date.

2.4 BOND MARKETS

Long-term government bond yields declined somewhat further in the euro area and the United States between the end of August and early October. These lower bond yields appear to be mainly driven by lower inflation expectations and related risk premia, as reflected in developments in long-term break-even inflation rates on both sides of the Atlantic.

Long-term government bond yields continued to decline, although to a moderate extent, in the euro area and the United States over the course of September (see Chart 10). Investors' inflation

concerns seem to have eased in the last few weeks, possibly as a response to the sharp fall in oil prices, thereby contributing to the decline in nominal bond yields. Overall, ten-year government bond yields in the euro area fell by around 10 basis points between end-August and 4 October 2006, to stand at 3.8% on the latter date. In the United States, the decline was somewhat higher, at around 15 basis points, with ten-year government bond yields falling to around 4.6% on 4 October. As a result, the differential between US and euro area ten-year government bond yields narrowed further and stood at around 85 basis points on 4 October. By contrast, in Japan ten-year government bond yields rose slightly with respect to their levels at end-August, standing at around 1.7% at the end of the period under review. Developments in implied bond market volatility suggest that market participants' uncertainty regarding short-term bond market developments decreased slightly in both the euro area and the United States over the course of September.

Chart 10 Long-term government bond yields

(percentages per annum; daily data)

Sources: Bloomberg and Reuters.

Note: Long-term government bond yields refer to ten-year bonds or to the closest available bond maturity.

In the United States long-term government bond yields in September continued the downward trend that began in early July and was subsequently supported by the widespread perception that the Federal Reserve's monetary policy tightening could have come to a halt after the decision of the Federal Open Market Committee on 8 August to keep its federal funds rate unchanged for the first time in the last two years (see Box 1). The fall in US long-term nominal yields almost entirely reflects a decline in long-term inflation expectations and related risk premia as captured by break-even inflation rates (see Chart 11). Indeed, break-even inflation rates continued to decline at all maturities in September, most probably reflecting a significant easing of market participants' inflation expectations in the light of the sharp drop in oil prices and further evidence of an expected moderation in economic growth in the world's largest economy. The latter fact notwithstanding, real yields offered on long-term index-linked bonds remained broadly unchanged in September, lending some support to the interpretation that market participants' views regarding the extent of the anticipated slowdown in economic activity have not changed significantly over the last few weeks.

In the euro area, long-term bond yields also declined in September, albeit to a lesser extent than in the US market. Although some business confidence indicators about the outlook for economic activity released over the review period turned out to be lower than expected, the decline in long-term nominal bond yields mainly mirrored a moderation in inflation expectations and related inflation risk premia, as measured by break-even inflation rates. In all likelihood influenced by lower oil prices, euro area break-even inflation rates declined at all maturities (see Chart 11). The long-term break-even inflation rate derived from the difference between the yields on French nominal and index-linked government bonds maturing in 2015, an indicator of market participants' long-term inflation expectations, has fallen by about 10 basis points since end-August, and stood

Chart 11 Break-even inflation rates

(percentages per annum; daily data)

Sources: Reuters and ECB calculations.

Chart 12 Implied forward euro area overnight interest rates

(percentages per annum; daily data)

Sources: ECB estimates and Reuters.

Notes: The implied forward yield curve, which is derived from the term structure of interest rates observed in the market, reflects, among other things, the market expectation of future levels for short-term interest rates. The method used to calculate these implied forward yield curves was outlined in Box 4 of the January 1999 issue of the Monthly Bulletin. The data used in the estimate are zero coupon swap rates.

at 2.1% on 4 October. Long-term index-linked bond yields remained broadly unchanged at all maturities over the review period.

The implied forward overnight interest rate curve remained broadly unchanged at shorter horizons over the period under review (see Chart 12). Over medium to long-term horizons, however, the implied forward interest rate curve shifted downward somewhat.

Box 1

DEVELOPMENTS IN US BOND YIELDS AND STOCK PRICES AFTER PEAKS IN THE FEDERAL FUNDS TARGET RATE

On 29 June 2006 the Federal Open Market Committee (FOMC) raised the federal funds target rate by 25 basis points for the 17th consecutive time, to 5.25%. Subsequently, monetary policy expectations were reassessed: market participants anticipated that the likelihood of any further increase in short-term interest rates had decreased and that the federal funds target rate would begin to decline in early 2007. Reflecting this, following the FOMC meeting in June, US long-term bond yields declined and stock prices increased. To put these developments into a historical perspective, this box compares the recent reactions of US long-term interest rates and stock

prices with market patterns that unfolded after previous peaks in monetary policy tightening cycles in the period from the late 1980s onwards.

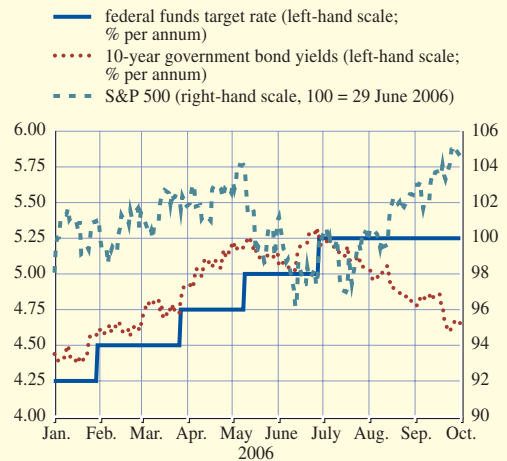

Changes in monetary policy expectations can feed into long-term bond yields and stock prices through their impact on the discount factor in the respective theoretical pricing formulas. In this regard, the expectations hypothesis states that the yield offered on a long-term bond is made up of the average of current and expected future short-term rates. Similarly, the dividend discount model suggests that the price of a stock is equal to the sum of the expected future dividends, discounted by a risk-free interest rate and the risk premium investors require for holding the share. Consequently, and all other things being equal (in particular earnings expectations), downward revisions in future expected short-term interest rates would exert downward pressure on long-term bond yields and have a positive impact on stock prices.

Chart A shows the developments in the federal funds target rate, the US ten-year government bond yield and the Standard & Poor's 500 index in 2006. It shows that, since the last decision to raise the federal funds target rate at end-June to its perceived peak level, long-term interest rates declined by 60 basis points and stock prices increased by around 5%. According to the theoretical arguments presented above, it may well be the case that these developments are closely linked to changing monetary policy expectations. In this context, it is interesting to compare the current asset price reactions with those occurring around previous peaks in tightening cycles by the Federal Reserve. During the last two and a half decades, three peaks in the federal funds target rate can be observed – in February 1989, in February 1995 and in May 2000. Charts B and C show the performance of US bond yields and stock prices in the four quarters following these peaks.

Two interesting features can be noted from the charts. First, US long-term bond yields have generally followed a downward trend after the federal fund target rate peaks. In particular, a marked decline in long-term bond yields was noticeable in the first two quarters following the peak in the federal funds target rate in all three episodes. Second, on two out of three occasions, the Standard & Poor's 500 index rose after the peak in short-term interest rates. However, on the third occasion, i.e. in the period following the May 2000 peak in policy rates, stock prices declined. The main factors behind this decline were probably, on the one hand, heavy downward revisions to earnings expectations, particularly for firms belonging to the “new economy”, as best epitomised by internet firms, and, on the other, a much reduced risk appetite on the part of investors. Thus, the asset price reactions between end-June and early October this year have so far to a large extent mirrored those occurring after previous peaks in the federal funds target rate.

Note: The peaks refer to 24 February 1989, 1 February 1995 and 16 May 2000. Index rebased to 100 on each peak day.

This notwithstanding, any comparison between asset price reactions over time should be treated with caution and not be interpreted in a mechanical way. Importantly, such a comparison implicitly assumes that all other potential factors driving bond yields and stock prices do not dominate the impact of changing monetary policy expectations over the periods concerned. In this respect, it should be borne in mind that long-term nominal and real interest rates in most major markets are still at relatively low levels, both in absolute terms and relative to macroeconomic fundamentals. Unusually low risk premia have in all likelihood had a dampening effect on bond yields, partly reflecting still ample liquidity conditions and a stronger general demand for long-term fixed-income instruments from institutional investors, oil-exporting countries and other foreign investors.¹ Looking ahead, it cannot be excluded that future bond yield developments may be influenced by a normalisation of bond market risk premia, which would work against the typical reaction pattern described above.

¹ See the box entitled “Recent developments in long-term real interest rates” in the April 2005 issue of the Monthly Bulletin.

2.5 INTEREST RATES ON LOANS AND DEPOSITS

In July 2006 MFI interest rates continued their upward trend, while remaining at a relatively low level.

In July 2006 short-term MFI interest rates generally increased as compared with the previous month. In most cases these increases were of broadly the same order of magnitude as those observed for comparable money market rates (see Table 4 and Chart 13). At the same time, changes in MFI interest rates on bank overdrafts, overnight deposits and deposits redeemable at notice of up to three months have, as is normally the case, been less pronounced.

Looking back over a somewhat longer period, most short-term MFI interest rates over the past few months have risen closely in line with movements in money market rates, which have been

1) The weight-adjusted MFI interest rates are calculated using country weights constructed from a 12-month moving average of new business volumes. For further information, see the box entitled "Analysing MFI interest rates at the euro area level" in the August 2004 issue of the Monthly Bulletin. Quarterly data refer to the end of the quarter.

2) Figures may not add up due to rounding.

increasing since September 2005. The three-month market rate, for instance, rose by more than 95 basis points in the period between September 2005 and July 2006. By comparison, MFI interest rates on deposits with an agreed maturity of up to one year shifted upwards by around 75 basis points. The increases in MFI interest rates on loans at floating rates and an initial rate fixation of up to one year were somewhat higher, ranging between around 80 to 90 basis points, with the exception of MFI interest rates for loans to households for consumption, which rose by around 35 basis points.

In July 2006 long-term MFI interest rates generally increased (see Table 4 and Chart 14). These increases were in some cases larger than those in market interest rates of comparable maturity in the period up to July 2006. This is likely to reflect the fact that there are typically some lags in the adjustment of retail banking rates to changes in market interest rates. At the same time, it should also be noted that the sharp increase (of more than 60 basis points) in MFI interest rates on deposits from non-financial corporations with an agreed maturity of over two years largely reverses the large decreases observed over the preceding two months.

Chart 13 Short-term MFI interest rates and a short-term market rate

(percentages per annum; rates on new business; weight-adjusted¹⁾)

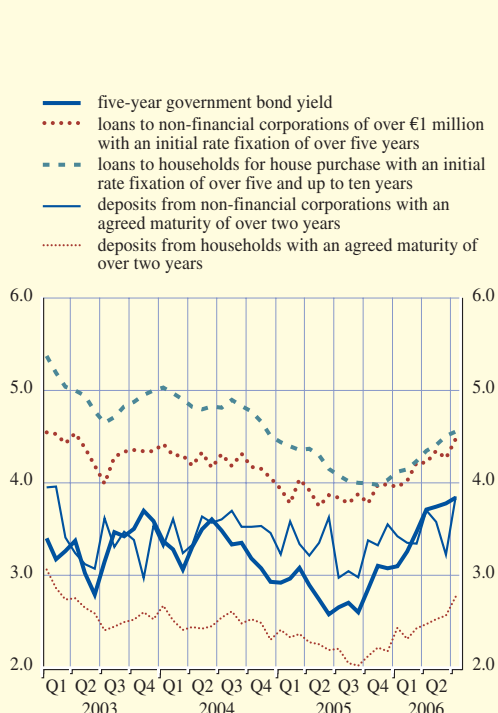

Source: ECB.

1) For the period from December 2003 onwards, the weight-adjusted MFI interest rates are calculated using country weights constructed from a 12-month moving average of new business volumes. For the preceding period, from January to November 2003, the weight-adjusted MFI interest rates are calculated using country weights constructed from the average of new business volumes in 2003. For further information, see the box entitled "Analysing MFI interest rates at the euro area level" in the August 2004 issue of the Monthly Bulletin.

Chart 14 Long-term MFI interest rates and a long-term market rate

(percentages per annum; rates on new business; weight-adjusted¹⁾)

Source: ECB.

1) For the period from December 2003 onwards, the weight-adjusted MFI interest rates are calculated using country weights constructed from a 12-month moving average of new business volumes. For the preceding period, from January to November 2003, the weight-adjusted MFI interest rates are calculated using country weights constructed from the average of new business volumes in 2003. For further information, see the box entitled "Analysing MFI interest rates at the euro area level" in the August 2004 issue of the Monthly Bulletin.

Looking back over a somewhat longer period, the majority of long-term MFI interest rates have followed the upward movements in equivalent market interest rates that have been observed since September 2005. The size of these increases – in the range of around 40 to 85 basis points – has, however, remained considerably below that recorded in long-term market interest rates, thereby reducing bank spreads. The five-year euro area government bond yield, for instance, rose by more than 120 basis points between September 2005 and July 2006. By comparison, MFI interest rates on loans to households for house purchase with an initial rate fixation of over five and up to ten years increased by only around 55 basis points. In the case of loans to non-financial corporations with an initial rate fixation of over five years, MFI interest rates on loans of over €1 million increased by more than those on loans of up to €1 million between September 2005 and July 2006 (by around 60 and 40 basis points respectively). This implies that there is currently no longer a significant interest rate differential according to the size of the loan. The increases in long-term deposit rates between September 2005 and July 2006 were somewhat higher. MFI interest rates on deposits with an agreed maturity of over two years for households and non-financial corporations increased by around 75 and 85 basis points respectively.

2.6 EQUITY MARKETS

Stock prices in major markets continued to rise in September. There appears to have been a significant improvement in market sentiment since the substantial re-pricing of risk witnessed early in the summer, which has supported stock prices and a further decline in market participants' uncertainty as measured by implied stock market volatility. Lower long-term bond yields as well as solid actual and expected corporate earnings probably also contributed to the increases in stock prices.

Broad-based stock price indices in major markets continued to rise in September (see Chart 15). Improvements in risk appetite and risk perceptions, a further decline in long-term bond yields and solid actual and expected corporate earnings contributed to those developments. Euro area and US stock prices, as measured by the Dow Jones EURO STOXX index and the Standard and Poor's 500 index, increased by 3% and 4% respectively between the end of August and 4 October. Stock prices in Japan, as measured by the Nikkei 225 index, instead remained broadly unchanged over the same period. At the same time, stock market uncertainty, as measured by the implied volatility extracted from stock options, continued to decline from the peaks witnessed in mid-June, and currently stands at relatively low levels (see Chart 16).

US stock prices continued to rise during September and early October. The lower oil prices observed in recent weeks, and an increasing perception among market participants that monetary policy rates may have peaked following the decision of the Federal Reserve to keep rates unchanged

at the last two meetings of the Federal Open Market Committee, seem to have contributed to improving investors' appetite for risk and, consequently, to the rise in stock prices (see Box 1). Further support for stock prices stemmed from the decline observed in long-term bond yields, as these act as a discount factor on future corporate earnings. At the same time, both actual and expected earnings remained relatively sound, despite widespread expectations of a moderate slowdown in the US economy. Available information suggests that fund managers generally revised downwards somewhat their earnings growth expectations for the coming year, albeit – in line with the overall growth outlook – only to a moderate extent. In any case, it should be borne in mind that actual and expected earnings per share for listed companies in the Standard & Poor's 500 index have remained in double-digit territory over the last few months.

Euro area stock prices also increased further over the review period and, by early October, fully recovered the losses experienced during the turbulent period witnessed at the beginning of the summer months. As in the case of the US stock market, the decline in oil prices and an overall improvement in risk appetite among investors appear to have made a decisive contribution to the increase in stock prices. Euro area stock prices also seemed to be supported by the ongoing decline in long-term bond yields and the aforementioned decrease in implied volatility, which, by reflecting lower uncertainty about future stock price moves, may well have translated into lower premia requested by investors. In addition, both expected and actual profits remained strong in the euro area. With regard to the latter, stock market analysts expected the annual growth of earnings per share for companies included in the Dow Jones EURO STOXX index to remain robust at a rate of around 9% over the next 12 months.

3 PRICES AND COSTS

Until recently, euro area consumer price inflation was above 2%, largely as a result of sustained upward pressure on energy prices. Since early August 2006, oil prices have dropped significantly and this, together with a significant downward base effect, probably explains most of the estimated decline in HICP inflation in September to 1.8%. However, in the coming months, some upward base effects and the hike in the German value added tax rate in early 2007 are expected to have a significant impact on annual inflation rates. As a consequence, on the basis of current oil prices, inflation rates can be expected to pick up again later in 2006 and early 2007 to rates above 2%. In addition, there are several upside risks to inflation developments.

3.1 CONSUMER PRICES

FLASH ESTIMATE FOR SEPTEMBER 2006

According to Eurostat's flash estimate, overall HICP inflation was 1.8% in September, down from 2.3% in August (see Table 5). A detailed breakdown of the HICP components will be released in mid-October. The information available at the moment suggests that this slowdown might be related to the decrease in oil prices since early August and to a base effect stemming from oil price developments in September 2005.

HICP INFLATION UP TO AUGUST 2006

While HICP inflation has been stabilising at elevated levels or has even increased in the course of the first half of 2006 on account of energy and non-energy price developments, a slight decline has been observed in July and August. Headline HICP inflation eased in August to 2.3%, down from 2.4% in July, largely as a result of a drop in the price of crude oil in early August. The direct contribution of energy prices to annual HICP inflation, while easing somewhat in August 2006, remained however relatively high (around 0.8 percentage point).

Most likely because of adverse weather conditions, the monthly increase in the price of unprocessed food was also significant in August, as it had been in July (see Chart 17). The annual rate of growth of unprocessed food prices reached 3.9%, the highest rate of increase since September 2003 (4.3%), when extreme weather conditions had pushed unprocessed food prices up during the summer.

Sources: Eurostat, HWWA and ECB calculations based on Thomson Financial Datastream.

1) HICP inflation in September 2006 refers to Eurostat's flash estimate.

Developments in less volatile consumer goods and services prices have been more subdued recently. So far, the price of processed food does not appear to have been affected significantly by the upsurge in unprocessed food prices, since its annual rate of change has remained largely stable since March 2006. As regards prices of non-energy industrial goods, its year-on-year rate of change remained at 0.5% in August, the same rate as in July and down from 0.7% in June. Overall, the recent evolution of this component suggests that, although the oil price hike may have started to be passed on to some prices, its overall effect has so far remained quite moderate. A similar observation can be made for the price of services at the consumer level. Its annual growth rate eased between July and August. The favourable developments regarding non-energy goods and services in August should be considered with some caution: to some extent, they could be related to seasonal, i.e. temporary, factors, such as exceptional sales prices for durable goods or volatile fluctuations in package holiday prices.

3.2 INDUSTRIAL PRODUCER PRICES

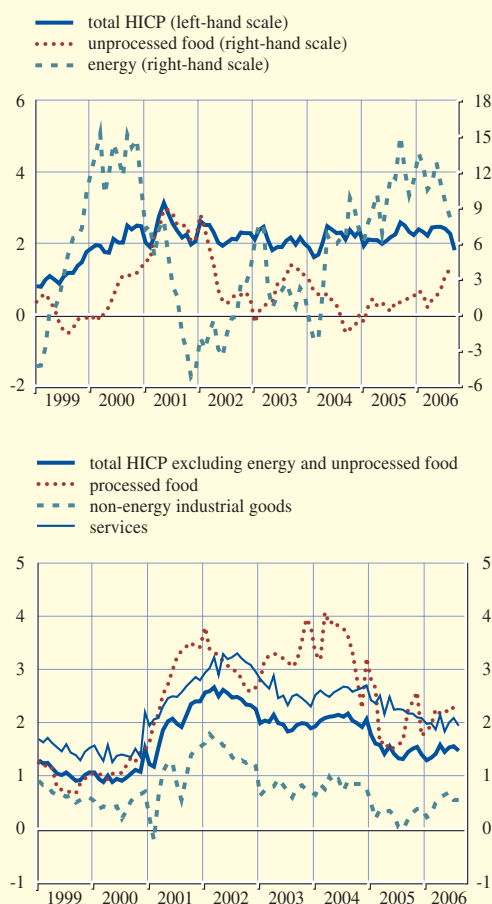

In August, the annual rate of change in industrial producer prices (excluding construction) declined somewhat to 5.7% (from 6.0% in July). This decline stemmed primarily from energy price developments, while the momentum for producer prices in the non-energy producing sectors was still that of ongoing increases, with elevated and increasing rates for intermediate goods prices (in year-on-year terms) and rather moderate developments for the price of consumer goods.

Looking in more detail at the various sectors, prices in the energy producing sector decreased on a month-on-month basis in August, in response to the fall in crude oil prices. In year-on-year terms, the rate is the lowest since May 2005 (see Chart 18). As regards intermediate goods prices, the annual rate of change remained particularly elevated, increasing from 6.2% in July to 6.5% in August. This rate is higher than those experienced during the earlier episodes of strong commodity price pressures in 1999/2000 and 2004.

Price developments in the consumer goods sector as a whole levelled off at 2.0%. Regarding the less volatile prices of the category, the annual rate of change of consumer goods excluding tobacco and food decreased slightly (from 1.2% in July to 1.0% in August). On the side of capital goods, the gradual increase in the annual rate of change has continued. Overall, the significant ongoing

Note: An index value above 50 indicates an increase in prices, whereas a value below 50 indicates a decrease.

pressure from intermediate goods prices tends to suggest that the underlying momentum is still that of a gradual pass-through of higher costs to later stages of the production stages.

Price-related survey indicators for September point to an increase in input price pressure in the manufacturing sector and some easing in the services sector. However, input price indices in both sectors, as reported by NTC Economics, remained high by historical standards, thereby continuing to signal strong upward pressure on prices at the firm level (see Chart 19). The indicator of prices charged increased in the manufacturing sector and, to a lesser extent, in the services sector. Both indices have also remained at high levels, suggesting that firms had been able to partly pass on higher input costs to customers.

3.3 LABOUR COST INDICATORS

In the second quarter of 2006, the annual rate of growth of negotiated wages in the euro area increased to 2.4%, from 2.1% in the first quarter (see Table 6 and Chart 20), which is slightly above the levels observed in 2004 and 2005 (2.1% on average). The annual growth of overall hourly labour costs also increased in the second quarter, to 2.4%, from 2.2% in the first quarter. These indicators suggest that compensation per employee growth could have increased slightly in the second quarter of 2006, after a moderate increase during the first quarter, which was driven by a significant rise in the industrial sector (see Chart 21).

However, despite this pick-up in labour costs, the figures available for the second quarter may reflect some short-term volatility. In particular, labour costs have been influenced by the impact of a one-off payment in the German industrial sector. In addition, the rise in the annual rate of growth of overall hourly labour costs stemmed mainly from an increase in non-wage costs (a category which covers, for instance, employers' social security contributions as well as employment taxes); whereas the growth of wage costs was almost stable.

Lastly, labour productivity growth – which picked up in year-on-year terms from 1.1% in the first quarter to 1.4% in the second – should help to contain unit labour cost growth in the second quarter. Overall, inflationary pressures from the labour market have remained subdued, but developments in the third quarter will have to be monitored closely with a view to assessing whether the second quarter pick-up was of a transitory nature.

It should also be noted that, owing to a different coverage and the potential for wage drift, the indicator of negotiated wages can only be seen as a rough indicator of actual wage developments. As detailed in Box 2, wage drift developments are crucial for assessing the inflationary pressures stemming from the labour market.

Box 2

RECENT DEVELOPMENTS IN EURO AREA WAGE DRIFT

There are several indicators of nominal labour costs in the euro area.¹ In this context, wage drift refers to the part of compensation per employee growth which is not explained by growth in negotiated wages and salaries, and/or social security contributions. Wage drift is therefore an important additional measure of inflationary pressures stemming from the labour market. This box presents an estimate of euro area wage drift and discusses its determinants over the business cycle.

From a conceptual point of view, negotiated wages and salaries can be considered as the basic component of labour costs. During the bargaining process, employees and employers agree on contractual increases in basic pay for a given period of time. This is done on the basis of recent and expected economic developments, such as productivity growth and labour market conditions. However, economic conditions at both the firm and aggregate levels can evolve during the duration of the wage contract. As re-negotiating wage contracts is costly, they therefore often allow for additional elements, such as performance-based bonuses or compensation for overtime. The growth in wages and salaries actually paid thus differs from that of negotiated wages, and the gap between the two is defined as wage drift. The wage drift component is thus more likely to capture the effect of changes in economic conditions, such as improving labour market conditions, in the short term. As a result, measuring and understanding developments in the wage drift becomes particularly important for assessing the short-term wage outlook.

¹ For a discussion of the conceptual and statistical differences between these indicators, see Box 4 entitled "A comparison of the available labour cost indicators in the euro area: conceptual differences and their behaviour in the period 1999-2002", in the June 2003 issue of the Monthly Bulletin.

Actual data on the wage drift component of compensation are not available and need to be estimated. For the purpose of estimating euro area wage drift, the euro area indicator of negotiated wages as compiled by the ECB is assumed to provide a useful statistical representation of contractual basic pay. However, two caveats of this indicator need to be considered in this context. First, the negotiated wages series is based on an aggregation of non-harmonised national data. Second, in some euro area countries, backward-looking wage indexation clauses that adjust wage growth based on ex post realisations of inflation still exist. These clauses are generally not reflected in the indicator of negotiated wages. As a consequence, in case these clauses are activated, the measured wage drift may also reflect the effects of previously negotiated wage indexation. As regards wages and salaries actually paid, growth in compensation per employee provides the most reliable data source.

Compensation per employee and wage drift in the euro area

(annual percentage changes; annual data)

Sources: Eurostat, ECB and ECB calculations.

Taking these caveats into account, an estimate of the annual growth in the euro area wage drift is constructed as a residual component of annual growth in compensation per employee, after subtracting both growth in employees' and employers' social security contributions, and the growth in negotiated wages. The chart shows the annual growth rate of compensation per employee in the euro area decomposed into these three components, including an estimate of the euro area wage drift from 1996 to 2005. Given the data caveats mentioned above and the fact that the wage drift is measured as a residual item, these estimates should be assessed with caution.

The results of the decomposition show that, compared to negotiated wages, wage drift contributes much less to overall compensation per employee developments. Despite this, the wage drift component provides some information about the cyclical profile of compensation per employee growth. During the recent period of low real GDP growth, the wage drift has been small or negative with a trough at -0.5 percentage point in 2003. Beyond somewhat lower growth in negotiated wages, wage drift has been slightly negative on average in the last four years and is thus estimated to have contributed to moderate nominal wage developments. This negative contribution of wage drift follows three years of positive wage drift between 1999 and 2001 – a period of relatively strong economic activity in the euro area. These developments seem to confirm the nature of wage drift as the wage component that reacts to short-term changes in economic activity and labour market conditions. Beyond the contribution of wage drift, it is worth noting that growth in social security contributions also varies significantly over time. This contribution to overall wage growth was particularly large and negative in the period between 1998 and 2002, to some extent dampening the upward impact of positive wage drift on wage growth.

The short time period available for evaluating the determinants of wage drift makes it difficult to quantitatively pin down what is driving developments in wage drift. As also suggested by the

evidence in the above chart, wage drift is likely to be related to cyclical factors. During economic expansions, as demand and output rise and labour markets tighten, components of the wage drift, such as overtime or bonus payments, are likely to increase faster than basic pay in certain industries, regions or occupations. Furthermore, unexpected developments in factors that determine collectively agreed wages (e.g. deviations from expected productivity growth) and labour market conditions are likely to play an important role. However, owing to the measurement problems mentioned above, the effects of wage indexation clauses are also captured in estimated wage drift. As inflation has in recent years often surprised on the upside, the backward-looking nature of some wage contracts may have caused upward deviations of compensation per employee growth from negotiated wage growth. Lastly, wage drift is also influenced by factors of a more structural nature. For instance, shifts in the composition of the labour force and changes in the coverage of collective bargaining can influence the wage drift.

At the current juncture, little information is available about the extent of wage drift in the first half of 2006. Recent data on labour costs point to a gradual and moderate increase in nominal wage costs. In view of the prevailing economic conditions, close monitoring of the wage outlook is called for, in particular to avoid the emergence of second-round effects from past inflation increases in wage determination.

3.4 THE OUTLOOK FOR INFLATION

Recent oil price volatility implies that there is considerable uncertainty surrounding HICP inflation developments in the short term. The decline of HICP inflation to below 2% in September has to be taken with some caution as, on the basis of current energy prices, HICP inflation is likely to increase again above this level before the end of the year. In particular, base effects due to past oil price fluctuations are likely to exert upward pressure on overall inflation towards the end of 2006. Thereafter, the increase in the VAT rate in Germany is expected to have a strong upward impact on overall HICP inflation in early 2007. However, underlying domestic inflationary pressures are expected to rise only slowly, owing to continued wage moderation and the effects of heightened global competition.

Overall, risks to the outlook for price developments remain clearly on the upside. HICP inflation could be affected by stronger-than-expected developments in energy and non-energy commodity prices. In addition, there is a risk of higher-than-expected increases in administered prices and indirect taxes. In the short run, some potential upside risk is also posed by the recent volatility in unprocessed food prices. Furthermore, against a background of an improving labour market and economic growth outlook, there is a risk of stronger wage pressures than indicated in the September 2006 ECB staff projections.

4 OUTPUT, DEMAND AND THE LABOUR MARKET

Eurostat's first estimate of euro area real GDP growth in the second quarter of 2006 confirmed that the euro area economy expanded at a strong pace in the first half of the year. The expansion was mainly driven by domestic demand – in particular, investment – and supported by improving labour market conditions. The latest information available, including industrial production and survey data, suggests that growth will remain robust in the third quarter of the year, although most likely slightly below the growth rates observed in the first half of the year. Looking ahead, both external and domestic factors are expected to sustain the economic expansion. However, downside risks to this outlook remain in the long term, related to a renewed rise in oil prices, the disorderly unwinding of global imbalances and protectionist pressures.

4.1 OUTPUT AND DEMAND DEVELOPMENTS

REAL GDP AND EXPENDITURE COMPONENTS

Eurostat's first estimate of euro area real GDP growth in the second quarter of 2006 confirmed that economic activity expanded by 0.9%, quarter on quarter, following quarterly growth of 0.8% in the first quarter, which was revised upwards by 0.2 percentage point (see Chart 22).

The main driving force of economic activity in the second quarter was domestic demand (excluding inventories), which contributed by 0.7 percentage point to GDP growth, as in the first quarter. Investment showed significant dynamism, reaching a quarter-on-quarter growth rate of 2.1%, while consumption slowed to quarter-on-quarter growth of 0.3%. By contrast, the contribution from net exports decelerated markedly to 0.1 percentage point in the second quarter from 0.4 percentage point in the previous quarter, owing to a stronger decline in export growth than in import growth. Finally, the contribution of inventories was slightly positive in the second quarter, following a negative contribution in the previous quarter.

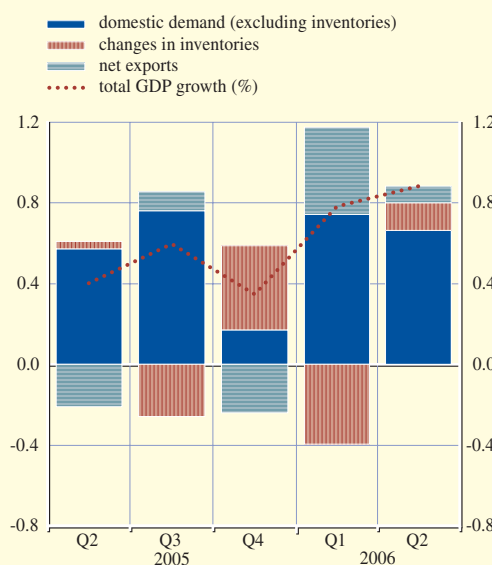

SECTORAL OUTPUT AND INDUSTRIAL PRODUCTION

The sectoral composition of economic activity reveals that growth in the first half of this year was broadly based across sectors. Value added growth in the services sector increased further in the second quarter, mainly on account of the strong performance recorded in market services. Moreover, value added growth in industry excluding construction remained strong, showing growth rates that have not been recorded in this sector since mid-2000. Finally, value added in construction rebounded strongly in the second quarter, partly on account of the unusually cold weather conditions in the first quarter.

Available data indicate that industrial activity in the euro area slowed down at the start of the third quarter, pointing to a slight deceleration

Chart 22 Real GDP growth and contributions

(quarter-on-quarter growth rate and quarterly percentage point contributions; seasonally adjusted)

Sources: Eurostat and ECB calculations.

in economic activity. Industrial production (excluding construction) fell by 0.4%, month on month, in July, after remaining stable in June (revised upwards by 0.1 percentage point). The decline can be partly explained by technical factors related to seasonal adjustment, as the drop of the seasonally adjusted series at the euro area level is stronger than that resulting from the aggregation of seasonally adjusted country data. The decline in production between June and July was broadly based across sectors, with the exception of the energy sector, where production rose, following large declines in previous months. The largest declines were recorded in the production of consumer goods, reflecting falls in production for both durables and non-durables, and in the production of intermediate goods, while that of capital goods remained broadly unchanged. On a three-month moving average basis, industrial production for the manufacturing sector accelerated further in the period between May and July, rising by 1.7% compared to the previous period (see Chart 23). This is still reflecting the strong growth recorded in May.

Chart 23 Industrial production growth and contributions

(growth rate and percentage point contributions; monthly data; seasonally adjusted)

Sources: Eurostat and ECB calculations.
Note: Data shown are calculated as three-month centred moving averages against the corresponding average three months earlier.

Finally, new orders in manufacturing increased by 1.8%, month on month, in July, following a relatively strong decline in June (2.2%). This improvement is confirmed by developments in the less volatile three-month moving average.

SURVEY DATA FOR THE INDUSTRIAL AND SERVICES SECTORS

The European Commission's industrial confidence indicator recorded an increase in September, while the Purchasing Managers' Index (PMI) for the manufacturing sector remained unchanged (see Chart 24). Both indicators remained broadly unchanged on average in the third quarter compared with the previous quarter, when they reached historically high levels. The movements in the components of the PMI were mixed in the third quarter. The assessment of changes in output and new orders recorded the strongest declines and were broadly counterbalanced by the increase in the assessment relating to stocks of purchased goods and the decline in suppliers' delivery times. Regarding the European Commission's industrial confidence indicator, an improvement in the assessment of order books in the third quarter was almost fully compensated by a decline in the assessment of stocks and, to a lesser extent, in the assessment of production expectations.

Turning to the services sector, the European Commission's confidence indicator declined in September, but it increased overall in the third quarter. This increase was due to the improvement in the assessment of both recent and expected demand, while the assessment of the business climate deteriorated slightly. By contrast, the activity index of the PMI for the services sector declined further in September and also for the third quarter as a whole, albeit from a very high level. Recent developments in the index still support the view of ongoing robust growth in the euro area services sector.

 3) Purchasing Managers' Index; deviations from an index value of 50.

Chart 25 Retail sales and confidence in the retail trade and household sectors

(monthly data)

Sources: European Commission Business and Consumer Surveys and Eurostat.
 1) Annual percentage changes; three-month centred moving averages; working day-adjusted.
 2) Percentage balances; seasonally and mean-adjusted. For consumer confidence, euro area results from January 2004 onwards are not fully comparable with previous figures due to changes in the questionnaire used for the French survey.

INDICATORS OF HOUSEHOLD SPENDING

Recent developments in retail sales give a positive indication for private consumption growth at the start of the third quarter. Retail sales volumes rose in August by 0.7%, month on month, following a rise of 0.4% in July (revised downwards by 0.2 percentage point). Moreover, in terms of three-month moving averages, there was an increase in August to 1.9% compared with 1.7% in July (see Chart 25). New passenger car registrations increased in August, following a marked decline in July. On a three-month moving average basis, current available data point to a decline in new car registrations at the start of the third quarter, following an increase of 1.7% in the previous quarter.

The European Commission's consumer confidence indicator increased in September, following a slight decline in August. Overall, consumer confidence increased in the third quarter, confirming the positive trend observed in the first half of this year. This increase resulted mainly from an improvement in unemployment expectations, while the assessment of the expected financial and economic situation and savings expectations remained broadly unchanged.

Overall, the latest household spending indicators and survey data provide a positive signal for private consumption growth at the start of the third quarter.

4.2 LABOUR MARKET

The latest information available confirms an improvement in euro area labour markets during 2006. Employment growth strengthened in the second quarter and the unemployment rate is expected to continue on a downward trend in the third quarter. Employment expectations, although showing mixed signals recently, also support the picture of ongoing employment growth in the short term.

UNEMPLOYMENT

The euro area standardised unemployment rate increased slightly between July and August 2006, to 7.9% (see Chart 26). However, this increase mainly reflects a rounding effect. The number of unemployed persons in the euro area increased in August by about 7,000, compared with a decline of about 15,000 in the previous month. Although developments in August are partly due to the high volatility that this series has shown in some countries, the decline in the number of unemployed persons seems to have levelled off in recent months. This is assumed to be partly associated with an increase in the participation rate, in line with better labour market prospects.

EMPLOYMENT

The latest data available confirm the gradual strengthening of employment developments since the start of 2005, from 0.1% quarter-on-quarter growth in the first quarter of 2005 to 0.4% in the second quarter of this year (see Table 7). Available information at the national level suggests that recent developments are the result of sustained employment growth in the services sector, particularly market-related services, and of an acceleration in employment in construction. In addition, employment in industry excluding construction is expected to have contributed less negatively to overall employment growth.

Employment expectations derived from the European Commission's business surveys and the PMI employment indices showed an improvement between August and September for the industrial sector. By contrast, both indicators were less positive for the services sector, indicating either a slight decline or broadly unchanged levels. Overall, employment expectations remain at high levels over the third quarter and are consistent with the assessment that euro area labour market conditions are gradually improving alongside stronger economic activity.

4.3 THE OUTLOOK FOR ECONOMIC ACTIVITY

Available information suggests that economic growth should remain robust in the short term, although slightly below the growth rates observed in the first half of the year. Both external and domestic factors support this assessment. On the external side, global economic activity remains fairly robust and provides continued support for euro area exports. On the domestic side, a continued improvement in business confidence indicates that short-term prospects for investment remain strong. In addition, consumption is foreseen to become more dynamic in the coming quarters in line with improvements in real disposable income, as the labour market situation improves further. The risks to this outlook are considered to be balanced over the short term and on the downside over the long term, mainly related to the possibility of a renewed increase in oil prices, the disorderly unwinding of global imbalances and protectionist pressures.

5 EXCHANGE RATE AND BALANCE OF PAYMENTS DEVELOPMENTS

5.1 EXCHANGE RATES

In nominal effective terms, the euro continued to trade within a relatively narrow range in September, depreciating overall by half a percentage point in the course of the month. The weakening of the euro primarily reflected its depreciation against the US dollar and, to a lesser extent, the Chinese renminbi.

US DOLLAR/EURO

By contrast with developments in August, the euro tended to depreciate against the US dollar in September (see Chart 27). Much of the decline in the euro exchange rate took place in the first three weeks of the month, despite near-term market expectations of a further narrowing of interest rate differentials between the United States and the euro area. The US dollar seems to have been supported, during this period, primarily by the sizeable drop in oil prices and its potential impact on the outlook in the United States. Towards the end of September and in early October, the euro regained some strength against the US currency and tended to stabilise at around USD 1.27 thereafter. This development was reportedly associated with additional signals that the US economic growth is moderating, as evidenced by a further deceleration of housing market activity and an unexpected decline in business sentiment. On 4 October, the euro stood at USD 1.27, i.e. 1.3% below its end-August level and 2.0% above its 2005 average.

JAPANESE YEN/EURO

After reaching a historical high of JPY 150.6 on 1 September, the euro began to depreciate against the yen in the first three weeks of the month (see Chart 27). This reversal may have been triggered by data showing strong capital expenditure in Japan. At the same time, market sentiment seemed also to have shifted more in favour of the yen, as evidenced by data on currency derivatives. Towards the end of September and early October, however, the single currency rebounded close to levels prevailing at the end of August. On 4 October, the euro was trading at JPY 149.8, i.e. almost unchanged compared with its end-August level and 9.5% above its 2005 average.

Chart 28 Patterns in exchange rates in ERM II

(daily data; deviation from the central parity in percentage points)

Source: ECB.

Note: A positive (negative) deviation from the central parity against the euro implies that the currency is on the weak (strong) side of the band. For the Danish krone, the fluctuation band is $\pm 2.25\%$; for all other currencies, the standard fluctuation band of $\pm 15\%$ applies.

EU MEMBER STATES' CURRENCIES

In September, most currencies participating in ERM II remained stable and continued to trade at or close to their respective central rates (see Chart 28). The Slovak koruna continued to strengthen and traded 3.1% stronger than its ERM II central rate on 4 October. On 26 September, Národná banka Slovenska raised its main policy interest rate by 25 basis points to 4.75%. With regard to the currencies of other EU Member States, the euro remained stable against the pound sterling – being quoted at GBP 0.67 on 4 October, i.e. at the same level as at the end of August and 1.4% below its 2005 average – while it appreciated marginally (0.6%) against the Swedish krona. As for the currencies of the largest new EU Member States, the euro also remained virtually unchanged, during the reference period, against the Czech koruna, the Polish zloty and the Hungarian forint. The relative stability of the forint in September and early October took place in spite of the recent political tensions in Hungary. The decision taken by Magyar Nemzeti Bank to raise its policy interest rate by 50 basis

Contributions to EER changes²⁾

From 31 August to 4 October 2006
(in percentage points)

Source: ECB.

1) An upward movement of the index represents an appreciation of the euro against the currencies of the most important trading partners of the euro area and all non-euro area EU Member States.

2) Contributions to EER-23 changes are displayed individually for the currencies of the six main trading partners of the euro area. The category "NMS" refers to the aggregate contribution of the currencies of the ten new Member States that joined the EU on 1 May 2004. The category "Other" refers to the aggregate contribution of the remaining seven trading partners of the euro area in the EER-23 index. Changes are calculated using the corresponding overall trade weights in the EER-23 index.

points (to 7.75%) on 25 September might have been a contributing factor to explaining the evolution of the Hungarian currency during this period.

OTHER CURRENCIES

Between end-August and 4 October, the euro rose by 4.0% vis-à-vis the Norwegian krone, mostly reflecting the potential implications of the sharp decrease in oil prices for the Norwegian economy. The euro appreciated against the Australian dollar (1.4%), the Swiss franc (0.9%) and the Canadian dollar (0.5%), while it depreciated vis-à-vis the Chinese renminbi (1.9%) and most Asian currencies linked to the US dollar.

EFFECTIVE EXCHANGE RATE OF THE EURO

In view of these developments in the bilateral exchange rates of the euro, the nominal effective exchange rate – as measured against the currencies of 23 of the euro area's important trading partners – on 4 October was 0.5% below its level at the end of August and 1.2% above its average level in 2005 (see Chart 29).

5.2 BALANCE OF PAYMENTS

The latest balance of payments data, up to July 2006, show a slowdown in the growth of both exports and imports of goods and services from the exceptionally robust growth rates recorded earlier in the year. The twelve-month cumulated current account registered a deficit of 0.6% of GDP in July, compared with a surplus in the previous year, mostly due to a fall in the trade surplus, reflecting higher oil and non-oil commodity import prices. In the financial account, combined direct and portfolio investment registered net inflows of €41.3 billion in the twelve-month period to July, mostly as a result of net purchases of euro area equity securities by non-residents.

TRADE AND THE CURRENT ACCOUNT

The growth in extra-euro area export and import values of goods and services declined in recent months after the exceptionally robust growth rates recorded earlier in the year. In July 2006, the three-month moving average of the value of exports and imports rose by 0.1% and 1.6% respectively, compared with growth rates in excess of 3% in the three-month period to April 2006 (see Table 8 and Chart 30). The slowdown in exports was largely due to weaker exports of goods.

Looking at the breakdown of trade in goods by volume and price (available up to the second quarter of 2006), the downturn in export values in that quarter is mainly explained by weaker growth in export prices (0.1%, quarter on quarter), while export volume growth also

decelerated somewhat (to 1.4%). The profile for export volumes is partly explained by the growth in foreign demand, which seems to have moderated in the second quarter. In addition, exports to the United States and Asia declined in that period and may have been affected by losses in price competitiveness due to the appreciation of the euro against the US dollar since the beginning of 2006.

The decline in the growth rate of imports of goods in value terms in the second quarter seems mainly due to import price developments, while import volumes grew at a moderate pace. Although robust euro area domestic activity, as well as the euro appreciation in the first half of 2006, should stimulate import demand, weaker exports in recent months may act as a drag on imports due to the high import intensity of exports. Meanwhile, imports from low-cost countries remain robust – especially imports from China and the new EU Member States – indicating increasing import penetration from low-cost suppliers.¹ In the first half of the year, the value of imported goods from China and the new EU Member States increased by around 26% and 19% respectively,

¹ See Box 6 of the August 2006 issue of the Monthly Bulletin for further details of rising imports from low-cost countries and their impact.

(EUR billions; monthly data; 12-month cumulated flows)

Source: ECB.

compared with the same period last year. As a result, imports from each of these two low-cost suppliers now account for around 10% of extra-euro area imports, thereby exceeding the share of imports from the United States.

The growth in import prices declined significantly in the second quarter, slowing down to 0.1% quarter on quarter (Chart 31). Although imported energy and non-energy commodity prices continued to increase, their growth rate – in euro terms – was more subdued compared with developments in the preceding quarters. Meanwhile, import prices of manufacturing products declined slightly in the second quarter, particularly for capital and consumer products. The apparent easing of the upward pressure on import prices can partly be attributed to the appreciation of the euro vis-à-vis the US dollar, which helped to dampen commodity prices as these are mainly denominated in US dollars.

Taking a longer-term view, the 12-month cumulated current account of the euro area in July 2006 registered a deficit of €45.7 billion (around 0.6% of euro area GDP). The shift from a surplus of €21.0 billion in the previous year is largely explained by the decline in the trade surplus due to rising oil and non-oil commodity import prices.

FINANCIAL ACCOUNT

In the three-month period to July 2006, euro area combined direct and portfolio investment registered monthly average net inflows of €33.7 billion (Table 8). This was mainly the result of net inflows in portfolio investment, while direct investment recorded small net outflows. Net inflows of portfolio investment over this period were dominated by net inflows in equity securities (€35.8 billion), which have been rising since May this year, while net inflows in debt instruments declined somewhat.

As regards 12-month trends, developments in both direct and portfolio equity investment were affected by a base effect in July 2006. From July 2005 to June 2006, 12-month cumulated figures included the effects of an exceptionally large transaction which occurred in July 2005 and resulted in net inflows in equity and net outflows in direct investment of the same size, thereby leaving combined direct and portfolio investment figures unaffected (see the October 2005 issue of the Monthly Bulletin). As this transaction is no longer reflected in the 12-month cumulated figures, it accounts for most of the decline in the 12-month cumulated net outflows of direct investment and net inflows of portfolio equity investment in July 2006 (see Chart 32).

Against this background, net inflows in combined direct and portfolio investment amounted to €41.3 billion in the 12 months up to July 2006, resulting from net inflows in portfolio investment (€107.5 billion) that were only partly offset by net outflows in direct investment (€66.2 billion). Strong net inflows of €148.0 billion in portfolio equity securities, due to increased net purchases of these securities by non-residents, were the main reason for the net inflows in portfolio investment. Meanwhile, debt instruments recorded net outflows of €40.5 billion in the 12-month period to July 2006, particularly due to net outflows in money market instruments.

Large net purchases of euro area portfolio equity by non-residents may have been influenced by the rise both in euro area equity returns and in corporate earnings growth rates relative to those in the United States in the first half of 2006. Although the aforementioned developments seem most recently to have come to a halt, the improving economic outlook for the euro area and a general reallocation of cross-border equity flows from some developing economies towards developed countries may also have contributed to the increasing net inflows in euro area equity securities.

ARTICLES

DEMOGRAPHIC CHANGE IN THE EURO AREA: PROJECTIONS AND CONSEQUENCES

Projected demographic dynamics for the euro area, as for many other industrialised economies, are characterised by decreasing total and working age population growth and a gradual, but dramatic, ageing of the population. These projected developments are generally the result of low fertility rates combined with increasing life expectancy and will have a deep and wide-ranging impact on the euro area economy. This article first presents the key characteristics of the most recent demographic projections prepared by Eurostat. It then provides an assessment of the possible consequences of the projected demographic developments for economic growth, labour markets, public finances and financial markets in the euro area over the medium to long term. Finally, the article describes the possible implications for monetary policy and underlines the critical need for structural reform to help offset the negative effects of demographic change in the euro area.

I INTRODUCTION

In the euro area, low fertility rates imply that population growth is slowing down. Indeed, in around 20 years, the total population of the euro area is expected to start to shrink in absolute terms. Furthermore, the proportion of older people in the population is projected to keep increasing, and after 2020 there will be one person older than 64 for every three people in the working age population. Taken together, these developments will have important consequences. For example, the composition of labour supply will change as the proportion of older workers increases and total labour supply may even fall as the working age population shrinks. This may exert downward pressure on average real GDP growth and real GDP-per-capita growth, with significant consequences for pay-as-you-go (PAYG) pension and health care systems. Population ageing may also prompt changes in the savings/investment balance of households, with possible implications, for example, for asset prices and capital flows.

The aim of this article is to outline the key characteristics of the projected demographic changes in the euro area and to provide an assessment of their possible economic impact. The article includes a preliminary assessment of the possible implications for monetary policy and underlines the important role of structural reform in helping to counteract the adverse effects of ageing populations. The main analysis undertaken considers the current 12 Member State composition of the euro area. Although the euro area is likely to enlarge before the end of 2050 (the time horizon considered), it is uncertain to what extent.

Moreover, the analysis below discusses a number of policy scenarios, although it is likely that some important policy changes will be introduced before 2050 which cannot be fully anticipated. The analysis presented in this article therefore aims to present an illustration of the possible future macroeconomic developments for the current euro area in the face of demographic change.

The remainder of this article is organised as follows. Section 2 reviews Eurostat's most recent demographic projections and their underlying assumptions for the euro area. These are compared with the demographic projections published by the United Nations (UN) for the United States. Section 3 uses a growth accounting framework to discuss the implications of the projected future population trends for economic growth in the euro area. The impact that an ageing population could have on public expenditures, particularly on pension and health care systems, is examined in Section 4. Section 5 discusses the linkages between population dynamics and financial market developments. A box provides a preliminary assessment of the possible implications for monetary policy. Section 6 outlines the role of structural reform in helping to compensate for some of the negative effects of the projected demographic changes in the euro area. Finally, Section 7 concludes.

2 DEMOGRAPHIC PROJECTIONS

Demographic projections from Eurostat point to a gradual decline in total population growth

in the euro area (similar to that in the EU) over the period up until 2050.¹ This decline is not balanced across age groups, but mainly reflects lower growth in the working age population (for simplicity defined here as persons aged 15 to 64, although in a number of countries policy initiatives are under way to increase the retirement age), the size of which is projected to start to decline after 2012 (see Chart 1). At the same time, the number of persons not of working age is expected to continue to increase. These two developments imply, ceteris paribus, a gradual rise in the overall dependency ratio (defined as the ratio of those people below 15 and above 64 to those of working age) in the euro area, which is projected to increase from the current levels of about 50% to levels close to 80% by 2050.

The rise in the overall dependency ratio is mainly due to a rise in the old age dependency ratio (defined as the ratio of those people older than 64 to those of working age), which is projected to continue to increase from the current level of about 26% to a level close to 55% by 2050 (see Chart 2). By contrast, after

having declined gradually from almost 40% in 1970, the young age dependency ratio (defined as the ratio of those people below 15 to those of working age) is expected to stabilise at current levels close to 24%.

Within this aggregate picture for the euro area, there are some significant differences in the magnitude and pace of demographic change for individual euro area countries. The key demographic developments over the period up until 2050 are summarised for individual euro area countries in Table 1. This shows that for some countries, such as Germany and Italy, sharp decreases in the total, youth and working age populations are projected, while some smaller countries, such as Ireland and Luxembourg, are expected to experience

1 For the euro area, the main reference projections adopted are those prepared by Eurostat for the Ageing Working Group (AWG) of the Economic Policy Committee (EPC) of the EU and released in February 2006. For details of methodological aspects and underlying assumptions, see European Commission and Economic Policy Committee, "The 2005 EPC projections of age-related expenditure (2004-2050) for the EU25 Member States: underlying assumptions and projection methodologies" in European Economy Special Report 4/2005.

population gains. Generally speaking, relatively high (Ireland) or increasing (Luxembourg) fertility rates are the reason for these latter trends. However, one trend is common to all euro area countries, namely the expected significant rise in the population aged 65 and over and therefore a significant rise in the old age dependency ratio.

Projected demographic developments for the United States are different to those for the euro area in several respects (see Charts 1 and 2).² First, working age population growth is projected to decline gradually, but not to turn negative in the United States, falling from the current levels of about 1% per annum to about 0.5% per annum after 2020. Second, the dependency ratio is expected to increase in the United States overall, as in the euro area, but from around 50% to levels close to 60% after 2030. Similar to the euro area, developments for the United States result from divergent patterns in age-specific dependency ratios: the young age dependency ratio is anticipated to marginally decline, while the old age dependency ratio is expected to increase. However, the increase in the old age dependency ratio in the United States is projected to be significantly smaller than that in the euro area. Thus, the

main difference between the euro area and the United States is that, while both areas face a process of gradual ageing, in the euro area it is more dramatic.

The different projected demographic patterns between the euro area and the United States result from clear differences in all of the main underlying assumptions which govern the expected future developments in fertility, life expectancy and migration. Specifically, the fertility rate (defined as the average number of births per woman) is assumed to remain broadly unchanged at the current low level of about 1.5 children per woman (below the replacement rate of 2.1 children per woman) in the euro area. In the United States, fertility (currently at about 2.0 children per woman) is projected to remain significantly higher than in the euro area, although with a slight decrease over the coming decade (to 1.9 children per woman). Life expectancy at birth (defined as the average number of years a person can expect to live at birth, given the prevailing mortality rates in that area and period) is assumed to

² For the United States, the main reference demographic projections are the medium variant projections published by the UN (the UN's World Population Database, 2004 revision, published in February 2005).

increase over the projection period in both the euro area and the United States (by about six years for men and five years for women in the euro area). At the same time, life expectancy in the euro area is expected to remain above that of the United States. Net inward migration rates (defined as the number of immigrants minus the number of emigrants, for every 1,000 people of the total population) are assumed to slow down, but to remain positive, in both areas. However, in the United States, the net migration rate (projected to decline from 4.0 on average in the period 2000-2005 to about 2.8 in the period 2045-2050) is assumed to remain well above levels in the euro area (where a decline in the net migration rate is projected from a historically high level of almost 4.0 on average in the period 2000-2005 – due mainly to recent migration policy developments in Spain – to about 1.9 in the period 2045-2050). The different net migration rates across economic areas may also contribute to the difference in projected fertility rates and dependency ratios, since migrants tend to be young with higher average fertility.

Needless to say, demographic projections are uncertain. They are based on assumptions which may imprecisely capture future changes. Moreover, the policy stance of several countries, for example regarding migration, may change over time, making past projections obsolete. In the past, projection errors for demographic factors have been substantial, especially over long horizons.³ Nevertheless, these errors tend to affect mainly the magnitude of the projected changes, rather than the anticipated general patterns themselves, which are consistent across different projection sources.

3 IMPACT ON REAL GDP GROWTH AND LABOUR MARKETS

It is difficult to quantify the potential impact of demographic change on labour markets and economic growth. Estimations of this impact are based on a number of assumptions which cannot fully capture the likely interactions

among individual components of growth. Therefore, the simulations presented within this section should be interpreted with some degree of caution. Nevertheless, they represent a useful reference point for policy discussions on the impact of demographic change.

From an accounting perspective, real GDP-per-capita growth can be seen as resulting from increases in labour productivity (defined here as output per person employed), labour utilisation (defined here as the ratio of the number of persons employed to the working age population) and demographic factors, which are captured by the evolution of the various age groups of the population. Table 2 reports four simulations of the impact of alternative labour market developments and the demographic projections on real GDP growth and real GDP-per-capita growth in the euro area.

Among the alternative scenarios considered, Scenario 1 presents a baseline for the growth impact of the demographic projections, based on the assumptions of unchanged labour productivity growth, unchanged labour utilisation growth (which are both assumed to grow in line with the recent averages presented in row 1 of Table 2) and an unchanged retirement age. Even in the event that no substantial reforms are undertaken in labour markets or pension and health care systems, these assumptions appear optimistic in the medium run, since labour utilisation components could reach their natural limits (corresponding for example to the frictional level of the unemployment rate and the upper ceiling of 100% for the participation rate) towards the end of the time horizon considered.

Given the uncertainty that surrounds projections for labour productivity and labour utilisation growth, an alternative Scenario 2 calculates the growth impact of Eurostat's demographic projections, this time incorporating the assumptions for labour productivity and labour

³ See the evidence reported in A. Maddaloni et al., "Macroeconomic implications of demographic developments in the euro area", ECB Occasional Paper No 51, August 2006.

Sources: ECB calculations based on Eurostat and European Commission data.

Notes: Labour productivity is measured in terms of output per person employed. Labour utilisation is measured in terms of the number of persons employed per head of the working age population (which is defined as the population aged 15 to 64).

1) See the main text on Scenario 2 below.

utilisation growth developed recently by the European Commission.⁴ These assumptions imply that labour productivity growth in the euro area will increase from its current level of 1.0% to 1.7% over the forecast horizon (see column 1 in Scenario 2) and that growth in labour utilisation will decrease from 0.8% to 0.1% due to changes in the size and composition of labour supply over the same period (see column 2 in Scenario 2). These assumptions therefore present a more optimistic projection for labour productivity growth (particularly given that the last three decades have seen a gradual decline in euro area labour productivity) and a more pessimistic projection for labour utilisation growth than Scenario 1.

The result of Scenario 1 predicts that annual average real GDP growth will decline from 2.0% in the period 2005-2010 to 1.5% in the period 2011-2030, and to 1.2% in the period 2031-2050. The outcome of Scenario 2 shows slightly higher economic growth in the medium term, but identical long-term developments. In both scenarios, real GDP-per-capita growth

would also gradually decline, from the recent average levels of about 1.7% to about 1.4% by 2050.

Scenarios 3 and 4 show developments that would avoid significant declines in the average pace of economic activity through the implementation of far-reaching measures to increase labour productivity and/or labour utilisation components. Table 2 reports the average changes in each of these components that would be needed to keep real GDP-per-capita growth at the average observed during the 1995-2005 period (assuming that other output growth components remain unchanged at their 1995-2005 average). It shows for example that if labour utilisation continues to grow at its current rate of 0.8% per year (Scenario 3), average annual labour productivity growth would have to increase to about 1.3% over the whole projection horizon. This would imply the need for a significant increase in the

4 See G. Carone et al., "The economic impact of ageing populations in the EU25 Member States", European Commission Economic Papers No 236, December 2005.

implementation of structural reforms to support labour productivity and improvements in the macroeconomic environment. Alternatively, if labour productivity growth were to remain at its current level of 1% (Scenario 4), labour utilisation growth would have to increase gradually from its current level of 0.8% to about 1.1% by the end of the projection horizon. Although further improvements in labour utilisation are possible, its natural limits (namely when all of the working age population is actively working) could be reached well before 2050. This would imply the necessity to extend working lives, e.g. through increases in the retirement age and/or average annual hours of work, in the medium to long run. Moreover, even if real GDP-per-capita growth rates are maintained, real GDP growth could decrease significantly over time.

All in all, the qualitative conclusions of the simulations are very similar. Namely, unless structural policy changes which increase both labour utilisation and labour productivity are stepped up significantly, projected demographic developments are likely to imply a significantly lower trend potential output growth (and also a lower trend potential output growth per capita) for the euro area over the medium to long term.

4 EFFECTS ON PUBLIC FINANCES

Population ageing will put pressure on public finances by driving up ageing-related expenditure as the ratio of the number of recipients to the number of contributors rises. The most important expenditure effects are projected for public pension systems and for spending on health and long-term care. A report by the EPC's Ageing Working Group and the European Commission⁵ provides projections by national institutions on the effect of demographic change on a number of areas of public expenditure, including pensions, health care, long-term care, education and unemployment benefits. These projections are based on commonly agreed assumptions regarding the future behaviour of demographic and key

macroeconomic variables and the application of national models for the projection of pension system developments. They reflect only enacted legislation, which may take account of any provisions to come into force over time, but not possible future policy changes. The projections are summarised in Table 3 and discussed in turn below.

Regarding the effects of demographic change on pension systems, most public pension systems in Europe are based on the PAYG principle whereby current contributions finance current expenditure. The rising number of pensioners will put these systems under considerable strain as a diminishing number of workers has to provide the pension benefits for a growing number of retirees. The Commission study calculates that demographic change will cause a cumulative increase of more than 3 percentage points in pensions expenditure as a percentage of GDP for most euro area countries, with particularly large increases for Spain, Luxembourg and Portugal over the projection period (see Table 3). Furthermore, this report shows that pensions expenditure will rise rapidly in the two decades after 2010.

While these projections give a useful quantitative indication of upcoming pressures on pension systems, uncertainty remains regarding the actual effects, which could be even larger. In particular, the projections are based on favourable assumptions regarding the development of future labour productivity (the same as in Scenario 2 in Section 3) which may not materialise, especially if necessary structural reforms are not undertaken. In addition, there is a risk that once the concrete effects of already approved pension reforms start to be felt, political pressure to reverse these sustainability-improving reforms may increase. Moreover, the underlying scenarios may not adequately reflect the negative impact

5 Economic Policy Committee and European Commission, "The impact of ageing on public expenditure: projections for the EU25 Member States on pensions, health care, long-term care, education and unemployment transfers (2004-2050)", European Economy Special Report 1/2006.

2) Total expenditure does not include long-term care.

on labour supply and capital formation resulting from the need to finance higher pension expenditure.

Public health care expenditure is also set to rise with population ageing since the demand for health services tends to increase with age. However, while developments in the area of pension systems can be predicted with some degree of accuracy by modelling the mechanics of pension systems, forecasts for health expenditure are more problematic. This is because the development of health expenditures reflects the interaction of demand for and supply of health-related goods and services, which themselves depend on multiple factors, including specific incentive effects resulting from market structures, insurance arrangements and government regulation/intervention. Furthermore, as the entitlement to publicly financed health services is less precisely defined than in the area of pensions, discretionary policy changes can have a larger short-term impact on expenditure, adding to the difficulties of making accurate long-term forecasts.

Against this background, projections of health care developments are generally based on a mechanistic approach. In a first step, health and long-term care expenditure profiles are defined by age and sex on the basis of current observations. In a second step, the derived age and gender-specific expenditure levels are matched to demographic projections to generate total future expenditures. In addition, assumptions are made regarding the health status of older people in the future, which have an important impact on the projected expenditure pressures. On the one hand, projections of people's health status suggest that people will not only live longer, but they will also do so in better overall health. On the other hand, some costly chronic diseases, such as dementia, appear to be related to biological age and thus their prevalence could increase strongly with rising longevity. The report by the EPC and the European Commission adopts an intermediate baseline assumption which predicts that increased longevity is split equally between good and bad health.

With these assumptions, the projected increases in public expenditure for health and long-term

care as a percentage of GDP amount to between 1 and 3 percentage points by 2050 for most countries (see Table 3). However, this approach leaves out other effects that may be important. For example, the income elasticity of demand for health care is assumed to converge to unity, while estimates point to higher values than in the past, i.e. health care expenditure has tended to rise faster than income. In this regard, it has also been shown that it is the demand for quality, i.e. relatively expensive new medical technologies, which is driving expenditure, rather than an increase in the volume of existing medical procedures. Empirical studies suggest that technological progress has significantly contributed to past expenditure increases.

Some effects could in part offset the expenditure-increasing impact of demographic ageing. For example, with a declining number of children, expenditure on public education and on family allowances could decline as a percentage of GDP. Such offsetting effects, if any, are likely to be small, amounting to less than 1 percentage point in most countries (see Table 3). However, it should be noted that, with increasingly scarce labour due to low fertility rates, there may be higher pressure on governments to invest in all forms of education, including in particular lifelong learning, so that any decline in education expenditures may be smaller than expected.

Finally, the EPC and European Commission study presents estimates for the impact of ageing on unemployment expenditures, again using a mechanistic approach (see Table 3). The numbers are based on the same labour market assumptions as discussed above and thus should be considered with caution, but suggest that expenditure on unemployment benefits in the euro area as a percentage of GDP would decrease by 0.3 percentage point by 2030 and 2050.

Overall, current projections of the ageing-induced fiscal burden signal a clear and imminent need for policy action. Pension, health care and long-term care arrangements need to be adjusted to ensure their viability in

the face of demographic ageing. Public finances need to be put on a sound financial footing and budgetary flexibility needs to be ensured to reduce the vulnerability of public finances. Time is running short as the fiscal effects of demographic ageing will start to be felt within the next decade. Moreover, the above projections may even underestimate the upcoming pressures, calling for additional prudence in fiscal policies. In this regard, a further refinement of the methods to assess the fiscal effects of demographic ageing is warranted.

5 THE IMPACT ON FINANCIAL MARKETS

Population ageing affects financial markets through developments related to three main channels. First, population ageing affects the savings/investment balance of households, with possible implications for countries' external balances. Second, population ageing has an impact on how savings are actually invested, since it is likely that people belonging to different generations make different choices concerning the assets included in their portfolio. Third, policy-makers of economies where population ageing is already under way, such as the euro area, will carry out pension reforms which might implicitly affect financial markets.

With regard to the first channel, people belonging to different generations tend to make different choices concerning the balance between consumption and investment; thus, changes in the relative share of older versus younger people in the population can result in different GDP shares of consumption and investment. The impact of demographic changes on the savings/investment balance has been extensively researched using dynamic models based on the assumption that households smooth consumption over their lifetime and that the life cycle savings pattern is hump-shaped. Households are assumed to have higher saving rates during their working lives in order to fund their consumption while in retirement. Young people fund high levels of current consumption, possibly borrowing against their

human capital. Based on these assumptions, dynamic models, calibrated to fit the current ageing distribution in most developed countries, suggest that there could be a minor reduction in the *equilibrium real* interest rate (the long-term rate which balances savings and investment) over the next few decades, assuming that the retirement age remains constant at the current level (see box).

The impact of population ageing on the consumption/savings ratio also has implications for external balances. Countries in which the population is characterised by a high old age dependency ratio tend to support current account deficits and net capital inflows,⁶ because a relatively large population of dependent old people tends to have relatively lower aggregate saving rates.⁷

Turning to the second channel, demographic changes can affect the asset allocation chosen by investors, and thus asset prices, as individuals belonging to different generations are likely to choose a different mixture of assets in terms of risk, since the time horizon of their investment differs. Pensioners tend to be more risk-averse, as they cannot hedge financial risks through their salaries.

A large part of savings is invested in financial assets. As a result, an extensive discussion in the financial economics literature is taking place concerning the argument that developed countries with a shrinking workforce could in theory face a fall in securities prices (the “asset meltdown” hypothesis) when the currently active workforce (the baby boom generation) retires. Downward pressure on securities prices could materialise because a large elderly generation will sell financial assets to a smaller-sized middle-aged generation.⁸ At the same time, a possible reallocation of financial portfolios towards less risky assets could result in upward pressure on the prices of these assets, e.g. government bonds, making the overall impact on prices uncertain.

In general, the available empirical evidence based on historical data provides some supportive evidence of a link between demographics and financial asset prices.⁹ In quantitative terms, however, these estimated relationships suggest relatively limited scope for any sizeable effect of demographic changes on financial asset prices.

In addition, shocks to the supply of and demand for domestic financial assets could be absorbed by foreign demand and thus the “meltdown” in asset prices may be cushioned by capital inflows in search of higher expected returns. Recent work has shed some light on the empirical relationship between population ageing and international capital flows.¹⁰ Net equity inflows tend to increase with an ageing population as foreign investors are attracted by higher expected returns due to lower domestic savings. Conversely, net inflows in debt instruments (short and long-term debt securities) are negatively associated with the old age dependency ratio. This may stem from an increased demand for fixed income instruments, such as global government bonds, as older households shift their portfolio allocation towards less risky assets. Overall, these results suggest that the likelihood of a significant

6 From the balance of payments identity, net aggregate capital flows (= net inflows in FDI + net equity inflows + net debt instrument inflows + other net capital inflows) are equal to the current account deficit.

(holdings as a percentage of GDP)

Source: ECB.

decline in equity prices when the current workforce generation retires is very low.

Third, savings are mostly channelled to the financial markets via financial intermediaries and in particular through pension funds. The rising percentage of households' savings invested in the capital markets by the baby boom generation has contributed to increasing market capitalisation in most developed countries. The value of financial assets held through financial intermediaries by euro area households was around 130% of GDP at the end of 2004, compared with 110% of GDP at the end of 1995.

The pension fund industry is largely underdeveloped in most euro area countries, notwithstanding a significant increase in the value of assets held by private pension schemes over the last few years. Euro area households have channelled more funds towards insurance corporations and pension funds than towards banks (i.e. monetary financial institutions) or mutual funds (i.e. other financial intermediaries) over the last few years (see Chart 3). However, there seems to be scope for additional growth, especially if ongoing pension reforms support a move towards fully or partially funded pension systems.

Looking ahead, the increase in the importance of institutional investors, particularly pension funds, raises financial stability concerns related to their ability to meet future pension obligations. These concerns have partly been addressed by stricter solvency requirements and by promoting the use of defined contribution plans.

Demographic developments are also having an impact on the financial instruments required by market participants. Pension fund managers already highlight the need for an increased supply of financial instruments aimed at managing market, inflation and longevity risks, such as long-term debt (of high quality and high liquidity) and inflation-indexed instruments.

Box

IMPLICATIONS OF DEMOGRAPHIC CHANGES FOR MONETARY POLICY

The general consequences of demographic changes on financial markets described in Section 5 entail some specific implications for central banks. This box develops the analysis of the main channels described in Section 5, including references to the relevant literature, to explore how monetary policy may be affected by demographic change.

The "slow burn" nature of demographic developments indicates that their effects on monetary policy are likely to be moderate.¹ Population ageing, per se, is not expected to create an economic environment where pronounced inflationary or deflationary pressures might suddenly appear. Therefore, substantial responses from central banks to cope with foreseeable changes

¹ C. Bean, "Global demographic change: some implications for central banks", Overview Panel, Federal Reserve Bank of Kansas City Annual Symposium, Jackson Hole, Wyoming, 2004.

in the demographic structure over the next decades are not to be foreseen. However, without reforms, productivity and labour supply growth might be undermined, while spending pressures related to public expenditure and social security systems would increase and higher taxes may exert additional pressures on prices and wages. Therefore, in the event that the necessary structural reforms are not undertaken, monetary policy may in certain episodes have to respond to higher inflationary pressures.

In general, central bankers should pay due attention to the impact of demographic factors, as the considerable persistence that characterises population developments could contribute to protracted changes in the way monetary policy decisions affect the economy. Moreover, financial markets may already be anticipating some of the effects of population ageing on asset prices, such as potential changes in the equilibrium real interest rate, which are of indisputable relevance for monetary policy-makers. Finally, an ageing society may not undertake sufficient structural reforms as the median voter becomes older, which implies that the central bank may have to operate within a relatively less flexible economic environment.

The following paragraphs briefly summarise some findings from the literature on the way demographic changes may affect a number of important central banking issues: (1) the equilibrium real interest rate; (2) the yield curve; (3) the monetary policy transmission mechanism; and (4) the demands on monetary policy in an ageing society.

1 The equilibrium real interest rate

Population ageing is expected to contribute to declines in both investment and saving rates over the next decades. This development leads to an ambiguous impact of ageing on the real interest rate: in models that assume a closed economy, if domestic investment falls below domestic savings (because ageing has made the production process more capital-intensive and the capital-to-labour ratio has risen, lowering the returns on investment), the real rate is predicted to fall, as it becomes difficult for savers to find profitable investment opportunities. Conversely, if domestic investment remains above domestic savings, the real rate would move upwards so as to reflect the relative scarcity of financial funds to undertake the available investment projects.

Researchers have used overlapping generation models, in which individuals are grouped into different age cohorts, in order to ascertain the consequences of ageing for the equilibrium real interest rate. In general, the evidence suggests that, in the absence of further reforms to the pension system, population ageing could contribute to a relatively minor reduction in the equilibrium real interest rate of 50-100 basis points over 25-50 years. For example, Miles (1999) simulates the effects of ageing in the EU, finding that demographic factors could lead to a fall in the real interest rate of around 50 basis points up to 2030, followed by a partial recovery after the passing of the baby boom generation. Batini, Callen and McKibbin (2006) estimated that ageing may contribute to a decline in the real interest rate in Europe of up to 100 basis points by 2050.²

McKibbin, "The global impact of demographic change", IMF Working Paper No 06/9, 2006. See also, among many others, P. Antolin, F. Gonand, C. de la Maisonneuve, J. Oliveira and K. Y. Yoo, "The impact of ageing on demand, factor markets and growth", OECD Economics Department Working Paper No 420, 2005; A. Börsch-Supan, A. Ludwig and J. K. Winter, "Ageing, pension reform, and capital flows: a multi-country simulation model", University of Mannheim Discussion Paper No 04-65, 2004; E. Canton, C. van Ewijk and P. J. G. Tang, "Population ageing and international capital flows", European Network of Economic Policy Research Institutes, Occasional Paper No 4, 2003; and A. De Serres, C. Giorno, P. Richardson, D. Turner and A. Vourc'h, "The macroeconomic implications of ageing in a global context", OECD Economics Department Working Paper No 193, 1998.

2 The yield curve

According to the expectations hypothesis of the term structure of interest rates, the equilibrium real interest rate that market participants anticipate to prevail in the long run is one of the key factors determining the level of rates at the long end of the yield curve. When the equilibrium real interest rate is expected to fall moderately due to population ageing, the long end of the yield curve could also experience a decline from the moment such expectations are priced into bonds.

The magnitude of such an effect on the yield curve depends on two factors. The first is the size of the reduction in the equilibrium rate, which is influenced by the speed of demographic change: larger changes in the equilibrium rate are likely to be accompanied by more pronounced variations in long-term rates. The second factor is the degree of forward-lookingness of financial markets: if markets are sufficiently forward-looking, they would be able to anticipate the expected decline in future real interest rates as populations age and the long end of the yield curve would fall, while the short end would presumably remain largely unaffected. In other words, ageing could contribute to a modest flattening of the yield curve, but the large degree of uncertainty over both the decline in the equilibrium rate and the degree of forward-lookingness of financial markets³ suggests that the magnitude of this impact is very difficult to predict and presumably rather small.

As outlined in Section 5, the role of some financial intermediaries is set to rise in the euro area over the next decades. This could have an effect on the prices observed in certain markets, including a possible increase in prices in the fixed income market, which could be temporarily affected by large portfolio reallocations of these financial intermediaries.

3 The monetary policy transmission mechanism

According to the life cycle theory, individuals accumulate wealth during their working lives to finance consumption during retirement.⁴ Therefore, populations whose average age is closer to retirement are expected to exhibit higher wealth-to-income ratios. At the same time, expected imbalances in publicly financed pension schemes might make it plausible to consider that, after pension reform, an increasing number of retirees will fundamentally rely on their own accumulated wealth, as opposed to public pension provision, to sustain their consumption levels. Furthermore, as Bean (2004) suggests, longer life expectancy after retirement will presumably reinforce this effect.

Consequently, Miles (2002) argues that monetary policy, which is partly transmitted via asset prices, may increase its power to stabilise macroeconomic fluctuations through an increasingly important wealth channel.⁵

4 The demands on monetary policy in an ageing society

As population ageing contributes to higher wealth-to-income ratios, depending on the reforms of existing PAYG systems, public demand for leaning against “boom-bust” cycles in asset prices

3 For some evidence supporting a limited degree of forward-lookingness of financial markets see, for example, S. Della Vigna and J. M. Pollet, “Attention, demographics, and the stock market”, NBER Working Paper No 11211, 2005.

4 R. Brumberg and F. Modigliani, “Utility analysis and the consumption function: an interpretation of cross-section data”, in K. K. Kurihara (ed.), *Post-Keynesian Economics*, pp. 388-436, Rutgers University Press, 1954.

5 D. Miles, “Should monetary policy be different in a greayer world?”, in A. Auerbach and H. Herrmann (eds.), *Financial Markets and Monetary Policy*, pp. 243-76, Springer, 2002.

might rise in parallel with old age dependency ratios: in an older society, a significant proportion of households' wealth could be accumulated in real estate and financial assets, increasing the exposure of their income to asset price fluctuations. For instance, Poterba (2004) suggests that households headed by someone over 65 years old will hold almost half of all corporate stocks and 64% of all annuity contracts in 2040 in the United States, up from 33% and 50% respectively in 2001.⁶ This increased exposure of the population to asset price fluctuations is likely to occur at a time when a relatively large proportion of the population (the "old") would presumably seek to sell their assets in order to finance consumption during retirement.⁷

Hence, increasing old age dependency and wealth-to-income ratios could strengthen the case for leaning against asset price misalignments or "bubbles" (i.e. deviations of asset prices from their fundamental values), as the welfare losses stemming from "boom-bust" cycles in asset prices would presumably be larger in an older society.

Additionally, to the extent that a growing proportion of wealth is invested in nominal assets (i.e. assets whose return is not indexed to inflation), the central bank's mandate to maintain price stability might become even more important so as to avoid individual old age financial provisioning being eroded over time by relatively high inflation rates. In this regard, Bean (2004) suggests that public support for consumer price stability will also tend to increase over the next decades.

Börsch-Supan and J. K. Winter, "Population ageing, savings behavior and capital markets", NBER Working Paper No 8561, 2001.

6 POLICY MEASURES

To cope with the possible effects of demographic change, governments need to undertake further comprehensive reforms. Such reforms should aim to address specific problems in public pension and health care systems, reduce overall public debts, increase labour utilisation and strengthen the forces driving productivity and economic growth.

Projected demographic changes in the euro area make parametric reforms of existing public pension systems necessary, including increases in statutory retirement ages and reductions in replacement rates. It has been estimated that without further reforms pension contribution rates would need to more than double in some countries to above 40% of wages to keep these systems in balance; therefore, benefits from public pension systems would need to fall. However, the parametric reforms necessary to fully balance PAYG pension systems without the need for further increases in contribution

rates would probably be politically or economically unfeasible. They will therefore need to be complemented by systemic reforms to the financing of pension systems, for example, a move towards increased funding. This diversification may reduce the overall vulnerability of the pension arrangements ahead of the upcoming demographic changes. Furthermore, as the contribution of funded pension arrangements to overall pensions rises, the size of PAYG systems could be reduced to alleviate the fiscal burden over the long term.

The financing of such a transition may involve some burden-sharing between pensioners and contributors. One possible reform approach is to combine the introduction of partially funded pension arrangements with a transformation of PAYG systems into "notional defined contribution" (NDC) arrangements, which have been implemented in several EU countries outside the euro area. In essence, while maintaining the PAYG financing of pensions, such NDC schemes mimic the characteristics of

individually funded arrangements. Thus, the future individual pension depends exclusively on own-paid contributions into a “notional” pension account and a commonly applied accrual rate. As there is no intra-generational redistribution through the pension system, the perceived tax burden on labour should fall. This improves the incentives to work and can contribute to achieving higher employment rates. At the macro level, balance of the NDC scheme is ensured by limiting the interest rate received on the notional pension account to the rate of growth of the contribution base (e.g. the wage sum of the economy). As balancing these pension schemes generally requires considerable cuts in generosity compared with previous arrangements, current workers are required to build up pension claims by contributing to funded pension arrangements simultaneously. Regulations may need to be implemented to ensure the non-speculative character of retirement savings. Such regulation is also important from a public finance point of view as abrupt adverse asset price changes could force the government eventually to take over additional pension obligations.

In the area of health and long-term care, rising public expenditure pressures impose equally hard choices on many public health systems. To face the future burden, governments may have to raise contribution rates, streamline services and secure private financing and funding. In general, governments have found it difficult to curtail expenditure permanently by limiting access to some forms of (expensive) treatment. Thus, discussions in the relevant literature point to the importance of setting appropriate incentives for all participants. This may entail the introduction of patient co-payments, as already implemented in a number of countries. Strengthening market mechanisms in the relationship between patients, medical service providers and insurers can improve overall performance. Contracting and payment structures should reflect true resource costs and hard budget constraints to set the right economic incentives. Benchmarking of the performance of medical service providers can help to raise

transparency. Further integration of product and services markets in the EU could contribute to improving efficiency also in the health care sector.

Ageing populations in the euro area also make the implementation of labour market policies to increase labour market participation and employment all the more urgent. Participation and employment rates are particularly low for young people, women and older individuals, compared with the overall working age population, in many euro area countries. Furthermore, the overall level of average annual hours of work per worker in the euro area is low.¹¹ There is therefore a significant potential to increase the utilisation of the working age population through a rise in the number of people entering and working in euro area labour markets and longer working hours and/or lives.

To achieve this, a first important step is to further reduce the disincentives to work currently persisting within a number of euro area labour markets due to the interplay of taxes and benefits and the provision of early retirement schemes. Such systems create disincentives to work, particularly for second earners (which are often women) with a family, low-paid workers and the youngest and oldest workers. Policies to increase female labour market participation must aim to make it easier for women to combine family and work by increasing the flexibility of working hours and improving services for childcare and care of the elderly. Furthermore, it would be beneficial to improve incentives to continue working later in life, for example through gradual exit-from-work policies and increased provision of part-time or temporary positions for older workers, along with the necessary increases in the statutory retirement age. However, there must also be sufficient labour demand from employers

11 For more information on working hours in the euro area relative to the United States, see N. Leiner-Killinger, C. Madaschi and M. Ward-Warmedinger, “Trends and patterns in working time across euro area countries 1970-2004: Causes and consequences”, ECB Occasional Paper No 41, 2005.

to hire and/or retain older workers. Increased labour migration to the euro area offers a further potential avenue through which labour market participation and employment may be increased across all age groups. Policies to increase immigration should be supportive as outlined in the Integrated Guidelines for Growth and Jobs 2005-2008,¹² but most likely do not offer a solution to the demographic challenges due to the large number of working migrants that would be required.

The potential to increase labour productivity and economic growth will depend both on labour market policies to increase the overall skill levels of the workforce and on the rate at which technology advances in the euro area. The extension and deepening of the EU internal market and increased competition in EU services markets are among the policies needed to further improve the functioning of product markets to support labour productivity and job creation.¹³ Many countries will also need to embark on a sustained process of investment in human capital and research and development in order to offset the possible negative effects of population ageing on labour and total factor productivity. EU leaders adopted the European Youth Pact at the beginning of 2005, which endeavours to “improve the education, training, mobility, vocational integration and social inclusion of young Europeans” by, for example, monitoring policies for the integration of young people into the labour market and encouraging young people to develop entrepreneurship.¹⁴ It emphasises both the importance of raising the quality of education, which may help to offset the possible negative effects of population ageing on total factor productivity, and the importance of increasing the activity and employment rates of young people to help to offset the effects of demographic change on labour supply.

7 CONCLUSION

Projected demographic changes in the euro area are characterised by low fertility rates and

increasing life expectancy, which will lead to declining total and working age population growth and a gradual increase in the old age dependency ratio. The projections available from Eurostat suggest that the total euro area population will start to shrink in absolute terms in about 20 years, and by 2050 the old age dependency ratio will have reached almost 55% compared with 26% in 2006. Taken together, these developments will have important economic consequences. These include changes in the size and composition of labour supply in the euro area, as the proportion of older workers increases and fewer new workers enter the labour market to replace those leaving it. Under the assumption of unchanged labour utilisation and labour productivity growth, demographic trends imply a decline in average real GDP growth from its average 1995-2005 level of 2.1% to around 1% by 2050. Real GDP-per-capita growth will also decline. Implications for public expenditure include increases of above 3 percentage points in public spending on pensions and health care as a percentage of GDP for most euro area countries.

The projected ageing of the population may also have an impact on financial markets, enhancing the role played by institutional investors. This is likely to raise financial stability concerns, which are already being addressed by changes in the structure of pension plans and by stricter solvency requirements for institutional investors. In addition, these developments are likely to boost the role of governments in improving financial education and literacy in order to preserve households' savings.

The timely implementation of comprehensive and incentive-compatible reforms is needed to prepare for such possible consequences of

12 For more details on these Guidelines, see the box entitled “The Integrated Guidelines for Growth and Jobs 2005-2008” in the August 2005 issue of the Monthly Bulletin.

13 For further details, see “Competition, productivity and prices in the euro area services sector”, ECB Occasional Paper No 44, 2006.

14 For further details, see Annex 1 of the Presidency Conclusions of the Brussels European Council, 22 and 23 March 2005.

demographic change. Reducing public debt would contribute to improving fiscal sustainability and make public finances less vulnerable to the impact of ageing populations. Further adjustments to the structure of pension contributions and benefits are also needed. Regarding labour markets, increasing labour utilisation through policies to support higher labour market participation and employment rates, and increasing labour productivity growth through investment in human capital and completion of the internal market would help to counteract the dampening effects on output growth in the medium run in the euro area. Over a longer time horizon, increases in the statutory retirement age and/or average annual hours of work will also be necessary. Individual euro area countries are responsible for the design of their policies on employment and productivity within the framework of the Lisbon strategy¹⁵ and the Integrated Guidelines for Growth and Jobs 2005-2008. These Guidelines offer a broad range of suggested policies, which in the face of demographic change will need to be appropriately tailored to the relevant target groups.

The “slow burn” nature of demographic developments implies that their immediate effects on monetary policy are likely to be moderate. However, in the absence of sufficient implementation of the needed structural reforms detailed above, monetary policy could be indirectly affected. First, inflationary pressures could be influenced as labour becomes scarcer and there is pressure to raise taxes to finance ageing-induced increases in government spending. Second, to the extent that a growing proportion of wealth is invested in nominal (non-inflation-indexed) assets, the central bank’s mandate to maintain price stability might become even more important so as to avoid individuals’ retirement provisions being eroded over time by relatively high inflation rates.

In summary, the adverse demographic developments discussed in this article underline the urgent need for policy-makers to implement structural reforms which have the ability to promote the macroeconomic flexibility and dynamism of the euro area.

INTEGRATED FINANCIAL AND NON-FINANCIAL ACCOUNTS FOR THE INSTITUTIONAL SECTORS IN THE EURO AREA

In May 2006 the ECB published for the first time a set of annual integrated non-financial and financial accounts, including financial balance sheets, for the institutional sectors of the euro area.¹ Such comprehensive data on the different non-financial and financial activities of euro area households, non-financial corporations, financial corporations and government are important for a number of analyses, for instance with regard to the monetary transmission mechanism. This article explains the concept and methodologies underlying the new data set and highlights a few results for households and non-financial corporations.

I INTRODUCTION

Detailed and consistent statistics relating to the activities and balance sheet positions of the different institutional sectors of the economy are important for the economic and monetary analyses of the European Central Bank (ECB). One prominent example is the analysis of the complex chain of causes and effects along what is known as the monetary transmission mechanism, which tends to be more comprehensible when referring to activities of entities such as households or corporations.

Compared to previous official statistics for the euro area, the newly compiled, comprehensive and consistent set of non-financial and financial accounts by institutional sector, henceforth referred to as the “euro area accounts”, increases the number of breakdowns of non-financial and financial activities by institutional sector, and provides a level of detail similar to the official statistics of other major economic areas.² In addition, the statistical methodology adopted in the compilation of the new set of accounts guarantees consistency between the accounts of the various sectors. These enhancements thus contribute to closing a gap in the economic and financial statistics for the euro area which underpin the ECB’s monetary policy. The compilation of the euro area accounts is a joint project of the ECB and the European Commission (Eurostat), in close cooperation with the national central banks and the national statistical institutes of the European Union. For the time being, the euro area accounts are available on an annual basis for 1999-2004, but, from spring 2007 onwards, they will be followed by the regular publication of quarterly data.

This article sets out the main features of the euro area accounts. It starts by explaining the components of the integrated euro area accounts and the underlying concepts. It then presents the characteristics of the euro area as a whole, as well as specific features of the household and non-financial corporation sectors as the main institutional sectors. Subsequently, an analysis is made of some of the more important developments in recent years, with a particular focus on households and non-financial corporations.

2 MAIN FEATURES AND CONCEPTS OF THE EURO AREA ACCOUNTS

The euro area accounts enable the analysis of economic developments in the different institutional sectors (households, corporations and government) of the euro area, their interrelationships, and their relationships with the rest of the world. Macroeconomic developments, such as economic growth and inflation, are driven by the actions of the individual agents in an economy, while the economic behaviour of these agents varies quite substantially, depending on the institutional sector to which they belong. The newly compiled

- 1 See the press release of 31 May 2006 – First release of euro area accounts for institutional sectors (1999-2004) – and the joint ECB and Eurostat background note entitled “Euro area and European Union accounts for institutional sectors”, which includes a comprehensive set of tables using both a cross-sectoral and a time-series presentation (<http://www.ecb.int>).
- 2 The usefulness of a sectoral perspective in economic and monetary analyses has been highlighted in a number of articles in the ECB’s Monthly Bulletin. See, for instance, the article in the August 2002 Bulletin entitled “Saving, financing and investment in the euro area” and the article in the August 2006 Bulletin entitled “Sectoral money holdings: Determinants and recent developments”.

euro area accounts present a complete, consistent set of economic indicators for all of these sectors. They also establish, for the first time, consistency between financial and non-financial statistics, thereby allowing an integrated analysis of non-financial economic activities (such as consumption and gross fixed capital formation) and financial transactions (such as the issuance of debt securities and investment abroad). Finally, the accounts also contain consistent financial balance sheets, with the result that annual changes in the financial wealth of each euro area sector can now be investigated in depth.

The euro area accounts are generally presented on a non-consolidated basis. This means, for example, that a government unit's holdings of debt securities issued by another government unit of the same Member State are not netted out when compiling the financial balance sheet for the government sector. Transfers between government units are not removed in the non-financial accounts either.³ The sequence of interlinked euro area accounts has been compiled in accordance with the methodology of the European System of Accounts 1995.

2.1 INSTITUTIONAL SECTORS

Each institutional sector brings together institutional units with a broadly similar behaviour: financial corporations, non-financial corporations, general government, households and non-profit institutions serving households (NPISHs). Transactions with non-residents and the financial claims of residents on non-residents, or vice versa, are recorded in the "rest of the world" account. The sector accounts thus show the interactions among the different sectors of the euro area economy and between the euro area economy and the rest of the world.⁴

The household sector comprises all households, as consumers of goods and services, as well as resident unincorporated enterprises, with the latter category covering sole proprietorships and most partnerships that do not have an

independent legal status. The household sector therefore also generates output and entrepreneurial income. In the euro area accounts, NPISHs (charitable organisations, trade unions, etc.) are grouped together with households, and their economic weight is relatively limited. The non-financial corporation sector comprises all private and public corporate enterprises that produce goods for and provide non-financial services to the market. Accordingly, the general government sector excludes such public enterprises and comprises central, state (regional) and local government and social security funds. Thus the general government sector differs from what is generally referred to as the public sector.

For the first time, a complete and consistent rest of the world account for the euro area has been compiled. This means that cross-border transactions and financial claims between euro area Member States have been removed from the euro area rest of the world account and that, in this process, the asymmetries in the bilateral trade statistics have been eliminated.⁵ Consequently, imports and exports are much smaller than they would have been if simple aggregation of the national data had been used, given that about one-half of the external trade of the individual Member States is within the euro area.

2.2 FROM PRODUCTION TO BORROWING AND LENDING

Euro area accounts record, in principle, every transaction between economic agents during a certain period and show the opening and closing stocks of financial assets and liabilities in financial balance sheets. These transactions are grouped into a sequence of accounts, each of which covers a specific economic process,

3 This treatment differs from the government finance statistics shown in Tables 6.1, 6.2 and 6.3 of the "Euro area statistics" section of the Monthly Bulletin, since these data are presented on a consolidated basis.

4 This means that the euro area accounts incorporate (a slight transformation of) the euro area balance of payments and international investment position statistics.

5 As a result, there has been a very small downward adjustment (by less than 1%) of nominal euro area GDP.

ranging from production, income generation and income (re)distribution, through the use of income for consumption and investment, to financial transactions such as borrowing and lending. Each transaction is recorded as an increase in the “resources” of a certain sector and an increase in the “uses” of another sector. For instance, the resources side of the “interest” transaction category records the amounts of interest receivable by the different sectors of the economy, whereas the uses side shows interest payable. For each type of transaction, total resources of all sectors and the rest of the world equals total uses.⁶ Each account leads to a meaningful balancing item, the value of which equals total resources minus total uses or total changes in financial assets minus total changes in liabilities. Typically, such balancing items, such as GDP or saving, are important economic indicators. They are carried over to the next account. Table 3 at the end of this article shows an abbreviated presentation of the euro area accounts.

The production account, for example, records the output of goods and services as its main resource, to which taxes less subsidies on products are added to obtain total resources. The main use in the production account is “intermediate consumption” – i.e. the consumption of goods and services within another production process. The difference between resources and uses is the balancing item “gross value added”. This gross value added is then carried over as a resource into the next account, the distribution of income account, which yields “gross disposable income” as a balancing item. This conceptual and numerical interlinkage of the accounts ensures the consistent derivation of key economic indicators. The link between the non-financial accounts and the financial accounts is established by the balancing item “net lending/net borrowing”, which can be derived both from the last of the non-financial accounts (capital account) and from the financial transactions account. “Net lending/net borrowing” is derived from the capital account by comparing “gross capital formation” (mainly investment in capital

goods) plus the net acquisition of “non-produced, non-financial assets” (such as land or licences) with “gross saving” plus net “capital transfers”. If saving plus net capital transfers received exceed non-financial investments, a sector has a surplus of funds and becomes a net lender to other sectors. In the financial transactions account, this means that the sector acquires more financial assets than liabilities.⁷

2.3 NET FINANCIAL WEALTH AND REVALUATIONS

The financial balance sheets show the financial position of the sectors, broken down into categories of financial assets and liabilities (such as deposits, loans and shares), and how that financial position has changed during the reference period. The financial assets and liabilities are valued at market prices. The financial balance sheets change as a result not only of the accumulated financial transactions but also of other changes in assets. Although the latter category mainly reflects revaluations due to changes in the market prices of financial instruments, it also covers other concepts, such as debt cancellations. The consistent derivation of holding gains and losses by holding sector and by financial instrument allows comprehensive analyses to be made, e.g. of the effects of these changes on the economic behaviour of households and non-financial corporations.

The external financial assets and liabilities account shows the financial position of the euro area vis-à-vis the rest of the world. Naturally,

6 For transactions in assets, such as the incurrence of loans or the purchase of shares, a distinction is made between “changes in liabilities” and “changes in assets”, rather than between resources and uses. The rest-of-the-world account views cross-border transactions and positions from the perspective of the rest of the world. It therefore follows that euro area imports are recorded as resources and exports as uses.

7 The euro area financial and non-financial accounts and balance sheets have been compiled in a single process. Concomitantly, full consistency between the financial and non-financial accounts has been achieved for the government and financial corporation sectors and for the rest of the world (so there is no category “errors and omissions”). There are still discrepancies, equal in amount but opposite in sign, for the household and non-financial corporation sectors, but these are relatively small compared to a simple aggregation of the non-integrated national non-financial and financial accounts data.

price changes resulting from exchange rate developments largely determine the other changes in the rest of the world account.

3 CONTRIBUTIONS OF SECTORS TO MACROECONOMIC AGGREGATES

The euro area accounts comprise key economic indicators, both for the various sectors and for the euro area economy as a whole. This section presents some of the salient economic characteristics of the individual sectors in the euro area and their contribution to the development of important macroeconomic aggregates.

Most value added in the euro area (on average 58% in the period 1999-2004) is created in non-financial corporations, while slightly less than one-quarter is generated by household production activities in unincorporated enterprises and from owner-occupied dwellings (see Chart 1). General government accounts for slightly more than 10%. Most value added created in the corporate and government sectors is passed on to households in the form of wages or salaries and employers' social contributions. The vast majority of gross national income thus accrues to the household sector. Subsequently, it is somewhat reduced through the redistribution of income by means of taxes, net social insurance payments and other transfers, which are largely paid to the government (cf. the distribution of gross national income and gross disposable income in Chart 1).

Disposable income is available for consumption or saving. Over the period under review, non-financial investment by non-financial corporations exceeded saving (plus net capital transfers received), meaning that this sector was a net borrower. The general government sector also had a deficit, by contrast with households, whose saving largely exceeded their non-financial investments (e.g. in new housing and in unincorporated enterprises), although their fixed capital formation still

Chart 1 Share of resident sectors in key economic aggregates in the euro area 1999-2004

(period average; as a percentage of the total, unless specified otherwise)

Sources: ECB and Eurostat.

comprised more than 30% of the euro area total. Households thus provided financing to the other resident sectors and to the rest of the world, mostly through financial corporations. These institutions mainly act as financial intermediaries and typically also have a (relatively small) financial surplus.

The net lending and net borrowing of the resident sectors largely offset each other, which means that the euro area economy finances most of its (non-financial) investments through domestic savings. On balance, the euro area was a modest net borrower from 1999 to 2001 and a net lender from 2002 to 2004. The financial transactions account of the rest of the world shows these developments broken down by financial instrument.

Turning to the contribution of the sectors to the development of key macroeconomic aggregates, Charts 2 and 3 show the contribution of each sector to the annual nominal growth rates of euro area GDP and gross capital formation from 2000 to 2004 respectively. From Chart 2 it is clear that the fluctuations in the GDP growth rates predominantly stem from changes in the contribution of non-financial corporations. The

Chart 2 Contributions of sectors to the nominal growth rate of euro area GDP

Sources: ECB and Eurostat.

contribution to growth of value added generated in the household sector is more stable.

As expected, the growth of capital formation (in current prices) is fairly volatile. In the period 2000-02 it fell to zero, before subsequently increasing again (see Chart 3). The fluctuations in investment by non-financial corporations were even larger. The contribution by the household sector was relatively large in 2004.

4 ANALYSIS OF SECTOR ACCOUNTS FOR HOUSEHOLDS AND NON-FINANCIAL CORPORATIONS BETWEEN 1999 AND 2004

This section discusses the main features of the non-financial and financial accounts of households and non-financial corporations. To a large degree, interactions between these two sectors determine overall economic developments.

4.1 HOUSEHOLDS

As shown in Table 1, compensation of employees is the most important component of households' gross disposable income, with an average share of 74% in the period 1999-2004. Mixed income accruing to self-employed households and gross

operating surplus from owner-occupied dwellings accounted for 24%, while net property income represented 16%. A large component of property income receivable is interest income on deposits and debt securities held by households, which clearly exceeds the interest payable by households on loans; net interest receipts amounted, on average, to 2% of gross disposable income in the period 1999-2004. Since direct taxes and social contributions collected by the government exceeded the various transfers to households over this period, the net effect of these redistribution transactions on household disposable income has been negative, amounting on average to -13% of gross disposable income.

The annual growth rate of nominal gross disposable income increased in 2004, after declining substantially over the previous three years (see Chart 4). The increase in 2004 was largely related to a higher contribution of mixed income and operating surplus, while the preceding decline in income growth had largely been due to lower growth in the compensation of employees. The redistribution transactions had only a limited impact on the pattern of income growth in the years under review.

1) Share of gross disposable income of households and NPISHs; average for 1999-2004.

2) Components may not add up due to rounding.

Gross disposable income may be either consumed or saved. Saving includes the change in households' net equity in pension fund reserves, which mainly reflects payments made by employers into pension schemes. This relatively small component (see Table 1) is obviously not available for immediate consumption. Euro area households' gross saving (as a ratio to household gross disposable income) declined in 2000, but subsequently increased and remained broadly stable at levels close to 15% during 2004 (see Chart 5). This pattern was influenced by a number of factors. For instance, as a result of the strong growth in labour income and the positive income expectations prevailing at the end of the 1990s, households may have absorbed the concomitant rise in tax and social contribution liabilities by lowering their saving ratio. Moreover, the increase in financial and non-financial wealth at the end of the 1990s, in a context of rising equity and house prices, may have increased households' propensity to consume, thus

leading to a reduction in the saving rate. The return to a somewhat higher saving ratio in the period 2002-04 is likely to reflect both the protracted period of economic and financial uncertainty following the end of the "new economy" boom and concerns in a number of euro area countries related to the sustainability of social security systems.

Households invest their savings in either financial or non-financial assets; the latter type of investment mainly reflects the purchase of new housing and fixed investment by unincorporated enterprises. Households typically finance part of these investments by incurring debt in the form of loans. Through their decisions on saving, investment in assets and financing, households are able to transfer part of their income over time and thus to spread their spending over their life cycle. Households' net incurrence of debt as a proportion of their gross disposable income declined between 1999 and 2002, but rose again subsequently, to

Chart 4 Gross disposable income of households

Chart 5 Saving, investment and lending of households

(as a percentage of gross disposable income)

Sources: ECB and Eurostat.

somewhat more than 5% in 2004. At the same time, households' gross capital formation remained robust over the whole period (accounting, on average, for 10% of gross disposable income), owing mainly to low mortgage interest rates and anticipated further rises in house prices. Through the incurrence of debt and the accumulation of financial and non-financial assets, households can accommodate changes in their incomes, whether expected (e.g. on retirement) or unexpected (e.g. on becoming unemployed). Between 1999 and 2004, euro area households' investment in assets amounted, on average, to somewhat more than 20% of their gross disposable income, with a slightly lower share in the case of non-financial assets than in the case of financial assets (see Chart 5).

The net lending position of households was relatively stable over the period 1999-2004, at an average of 5% of their gross disposable income. This position of the household sector as a net lender has, in recent years, been compatible with an increase in the net incurrence of debt, because higher borrowing has been accompanied by a broadly similar increase in net financial investment. Of course, these general trends conceal varying developments within the household sector.

Looking at the information provided by the financial accounts, changes in the net financial wealth of households reflect the net acquisition of financial assets, changes in the prices of financial assets and borrowing net of repayments of outstanding debt. Chart 6 shows that the changes in net financial wealth of euro area households over the period 2000-04 are largely attributable to changes in the market prices of financial instruments (mainly shares and other equity), while the net acquisition of financial assets as a percentage of gross disposable income remained fairly stable. It is interesting to note that the incurrence of new debts decreased at the time of high economic and financial uncertainty (particularly in 2001 and 2002) and has subsequently increased again in an environment of low levels of interest rates.

Over the period under analysis, developments in households' financial investment can be divided in two episodes. In 1999 and 2000 households invested heavily in shares and mutual fund shares, in an environment of strong rises in equity prices. From 2001 onwards, households increased the proportion of their investment in currency and deposits, reflecting a general preference for safe and liquid assets. Investment in life insurance and pension funds is by nature more stable and represented almost

Chart 6 Changes in financial assets, debt and net financial wealth of households

(as a percentage of gross disposable income)

Chart 7 Debt of households

(percentages)

Sources: ECB and Eurostat.

40% of the total financial investment of households.

One development in the balance sheet position of the household sector that has received much attention in the period since the end of the 1990s, owing to its potential implications for the monetary policy transmission process, is the increase in household indebtedness. The expansionary financing behaviour of households, along with partly subdued income growth, has led to further rises in the sector's aggregate ratio of debt to gross disposable income. At the end of 2004, this ratio stood at a little over 90% (up from 82% in the late 1990s) (see Chart 7). At the same time, the debt-to-financial assets ratio also increased, from 27% in 1999 to 32% in 2004. The ratio of debt to total assets may have increased less strongly, as, in an environment of strong house price rises, households' non-financial wealth may have increased faster than their financial wealth. Another important factor in the assessment of this rising debt-to-income ratio is the development of interest payable by households. As interest rates have generally been declining since 2000, interest payable as a percentage of gross disposable income decreased over this period, despite the higher levels of outstanding debt.

4.2 NON-FINANCIAL CORPORATIONS

Entrepreneurial income is a core indicator for corporations.⁸ It is an income concept that is comparable to current profits in business accounting (after net interest payments but before the payment of dividends and taxes). Table 2 shows that gross entrepreneurial income is derived as gross value added minus compensation of employees and taxes on production and imports, plus subsidies minus interest and rents payable, plus property income receivable from financial assets owned by non-financial corporations (including dividends and retained earnings from foreign direct investment).

The growth of the gross entrepreneurial income of euro area non-financial corporations increased in 2004, following decreases in the preceding years (see Chart 8). This pattern was due not only to developments in gross value added and the compensation of employees, but also to developments in non-financial corporations' property income receivable from financial assets – mainly dividends on their investments in other

⁸ Entrepreneurial income can be measured in net or gross terms. The latter includes consumption of fixed capital (depreciation).

Table 2 Non-financial corporations: from value added to entrepreneurial income

(EUR billions)

	1999	2000	2001	2002	2003	2004
Gross value added	3,247	3,449	3,642	3,751	3,817	3,962
- Compensation of employees	1,958	2,074	2,178	2,243	2,289	2,348
- Taxes on production and imports	100	103	105	107	108	115
+ Subsidies	51	49	50	50	50	51
Gross operating surplus	1,239	1,320	1,410	1,452	1,471	1,549
+ Property income receivable	211	300	331	308	295	315
- Interest payable	175	235	266	239	222	221

corporations. The fall in profit growth in 2002 and 2003 was to some extent mitigated by declining interest payments, in an environment of falling interest rates. The decrease in profitability between 2000 and 2003 is broadly in line with profitability developments based on aggregated firm-level data from annual financial statements for listed non-financial corporations.⁹ In an environment of favourable financing conditions, corporate balance sheet restructuring

and continued wage moderation, profit growth picked up strongly in 2004 and almost returned to the level prevailing in 2000. Moreover, despite the high debt ratio of the non-financial corporate sector, net interest expenditures did not act as a drag on profit growth in 2004.

⁹ See Box 5 entitled "Profitability and leverage developments of listed non-financial corporations in the euro area" in the June 2006 issue of the Monthly Bulletin.

Chart 11 External financing of non-financial corporations

(as a percentage of gross value added)

Sources: ECB and Eurostat.

Note: "Other" includes net equity of households in life insurance reserves and in pension fund reserves, other accounts payable and financial derivatives.

Non-financial corporations have to pay taxes and other current transfers and can distribute the remaining entrepreneurial income plus net capital transfers received to their owners, or retain it for investment in fixed capital and in financial assets.¹⁰ Chart 9 illustrates that the sum of taxes and net transfers payable, dividends payable and gross capital formation typically exceeds entrepreneurial income, so that non-financial corporations are net borrowers. This was particularly the case in 1999-2000. At the same time, this period was characterised by a substantial net acquisition of financial assets, predominantly in the form of shares and other equity, reflecting corporate mergers and acquisitions.¹¹ Consequently, the net incurrence of liabilities was also quite high in 1999 and 2000 (Chart 10). The subsequent subdued economic growth has contributed to a substantial relative decrease in the borrowing of non-financial corporations. In 2004 the growth of gross entrepreneurial income picked up again (see Chart 8), but so did growth of fixed capital formation (see Chart 3), which led to a broadly unchanged net borrowing position as compared with 2003.¹²

The net incurrence of liabilities by non-financial corporations is broken down by type of liability

in Chart 11. This chart shows that the dampening of borrowing needs after the investment boom of 1999 and 2000 resulted in a decline in the external funds raised through debt financing (loans and debt securities issued) and equity financing.

5 CONCLUSION

Euro area accounts, comprising integrated non-financial and financial accounts and financial balance sheets for the institutional sectors in the euro area, were released for the first time in May 2006. Euro area accounts provide a consistent framework for the analysis of economic and financial developments by

10 For a recent review of corporate finance in the euro area, see the article entitled "Developments in corporate finance in the euro area" in the November 2005 issue of the Monthly Bulletin, and the references therein.

11 See Box 4 entitled "Merger and acquisition activity and the composition of the financial account of the euro area balance of payments" in the August 2002 issue of the Monthly Bulletin and Box 4 entitled "Recent trends in merger and acquisition activity in the euro area" in the July 2006 issue of the Monthly Bulletin.

12 For a recent review of investment growth in the euro area in 2004, see Box 7 entitled "Latest developments in investment by type of product" in the May 2005 issue of the Monthly Bulletin.

institutional sector. They provide comprehensive information not only on the economic activities of euro area households, non-financial corporations, financial corporations and government, but also on the economic interaction between the euro area economy and the outside world by means of a complete rest-of-the-world account for the euro area. The consistency of these new statistics represents a major improvement, which, in the context of monetary and economic analysis at the ECB, enables a more accurate understanding of the production, income distribution, saving, investment and financing behaviour of economic agents in general and of the household and non-financial corporation sectors in particular.

The annual euro area accounts will be followed, from spring 2007 onwards, by the regular publication of quarterly sector accounts. Such a timely availability of a consistent set of non-financial and financial statistics will allow a more detailed assessment of the monetary transmission mechanism, for example by providing consistent data on income and wealth effects on household consumption and gross capital formation.

Source: ECB.

- 1) From 1 January 1999 to 9 March 2004, the date refers to the deposit and marginal lending facilities. For main refinancing operations, changes in the rate are effective from the first operation following the date indicated. The change on 18 September 2001 was effective on that same day. From 10 March 2004 onwards, the date refers to the deposit and marginal lending facilities and to the main refinancing operations (changes effective from the first main refinancing operation following the Governing Council discussion), unless otherwise indicated.
- 2) On 22 December 1998 the ECB announced that, as an exceptional measure between 4 and 21 January 1999, a narrow corridor of 50 basis points would be applied between the interest rates for the marginal lending facility and the deposit facility, aimed at facilitating the transition to the new monetary regime by market participants.
- 3) On 8 June 2000 the ECB announced that, starting from the operation to be settled on 28 June 2000, the main refinancing operations of the Eurosystem would be conducted as variable rate tenders. The minimum bid rate refers to the minimum interest rate at which counterparties may place their bids.

Source: ECB.

- The amounts shown may differ slightly from those in Section 1.1 due to operations allotted but not settled.
- With effect from April 2002, split tender operations, i.e. operations with one-week maturity conducted as standard tenders in parallel with a main refinancing operation, are classified as main refinancing operations. For split tender operations conducted before this month, see Table 2 in Section 1.3.
- On 8 June 2000 the ECB announced that, starting from the operation to be settled on 28 June 2000, the main refinancing operations of the Eurosystem would be conducted as variable rate tenders. The minimum bid rate refers to the minimum interest rate at which counterparties may place their bids.
- In liquidity-providing (absorbing) operations, the marginal rate refers to the lowest (highest) rate at which bids were accepted.
- An exceptional operation based on longer-term refinancing operation (LTRO) procedures was carried out because an erroneous bid had prevented the ECB from executing its LTRO in the full amount on the previous day.

1.4 Minimum reserve and liquidity statistics

(EUR billions; period averages of daily positions, unless otherwise indicated; interest rates as percentages per annum)

Source: ECB.

- 1) For this instrument category, new business and outstanding amounts coincide. End-of-period.
- 2) For this instrument category, households and non-financial corporations are merged and allocated to the household sector, since the outstanding amounts of non-financial corporations are negligible compared with those of the household sector in all participating Member States combined.
- 3) The annual percentage rate of charge covers the total cost of a loan. The total cost comprises an interest rate component and a component of other (related) charges, such as the cost of inquiries, administration, preparation of documents, guarantees, etc.

C25 Euro area government bond yields

(monthly; percentages per annum)

C26 10-year government bond yields

(monthly; percentages per annum)

Source: ECB.

- 1) To December 1998, euro area yields are calculated on the basis of harmonised national government bond yields weighted by GDP. Thereafter, the weights are the nominal outstanding amounts of government bonds in each maturity band.

- 1) Residential buildings, based on non-harmonised data.
- 2) Residential property price indicator for the euro area, based on non-harmonised sources.
- 3) Refers to the prices expressed in euro.
- 4) Brent Blend (for one-month forward delivery).
- 5) In 2000.
- 6) The quarterly data for the second (fourth) quarter refer to semi-annual averages of the first (second) half of the year, respectively. Since some national data are only available at annual frequency, the semi-annual estimate is partially derived from annual results; therefore, the accuracy of semi-annual data is lower than the accuracy of annual data.
- 7) Hourly labour costs for the whole economy, excluding agriculture, public administration, education, health and services not elsewhere classified. Owing to differences in coverage, the estimates for the components may not be consistent with the total.

Sources: ECB calculations based on Eurostat data.

1) Compensation (at current prices) per employee divided by value added (volumes) per person employed.

2) Value added (volumes) per person employed.

3) Deflators for exports and imports refer to goods and services and include cross-border trade within the euro area.

5.2 Output and demand

Source: European Commission (Economic and Financial Affairs DG).

- 1) Difference between the percentages of respondents giving positive and negative replies.
- 2) The economic sentiment indicator is composed of the industrial, services, consumer, construction and retail trade confidence indicators; the industrial confidence indicator has a weight of 40%, the services confidence indicator a weight of 30%, the consumer confidence indicator a weight of 20% and the two other indicators a weight of 5% each. Values of the economic sentiment indicator above (below) 100 indicate above-average (below-average) economic sentiment, calculated for the period from January 1985.
- 3) Owing to changes in the questionnaire used for the French survey, euro area results from January 2004 onwards are not fully comparable with previous results.
- 4) Data are collected in January, April, July and October each year. The quarterly figures shown are averages of two successive surveys. Annual data are derived from quarterly averages.
- 5) The confidence indicators are calculated as simple averages of the components shown; the assessments of stocks (columns 4 and 17) and unemployment (column 10) are used with inverted signs for the calculation of confidence indicators.

Sources: ECB for euro area aggregated data; European Commission for data relating to countries' deficit/surplus.

- Revenue, expenditure and deficit/surplus are based on the ESA 95, but the figures exclude proceeds from the sale of UMTS licences in 2000 (the euro area deficit/surplus including those proceeds is equal to 0.0% of GDP). Transactions involving the EU budget are included and consolidated. Transactions among Member States' governments are not consolidated.
- The fiscal burden comprises taxes and social contributions.
- Comprises total expenditure minus interest expenditure.
- Corresponds to final consumption expenditure (P.3) of general government in the ESA 95.
- Includes proceeds from the sale of UMTS licences and settlements under swaps and forward rate agreements.

Source: ECB.

- 1) Data are partially estimated. Annual change in gross nominal consolidated debt is expressed as a percentage of GDP, i.e. $[\text{debt}(t) - \text{debt}(t-1)] \div \text{GDP}(t)$.
- 2) The borrowing requirement is by definition equal to transactions in debt.
- 3) Includes, in addition to the impact of foreign exchange movements, effects arising from measurement at nominal value (e.g. premia or discounts on securities issued).
- 4) Includes, in particular, the impact of the reclassification of units and certain types of debt assumption.
- 5) The difference between the changes in the aggregated debt, resulting from the aggregation of countries' debt, and the aggregation of countries' change in debt is due to variations in the exchange rates used for aggregation before 2001.
- 6) Holders resident in the country whose government has issued the debt.
- 7) Includes residents of euro area countries other than the country whose government has issued the debt.
- 8) Including proceeds from sales of UMTS licences.
- 9) The difference between the annual change in gross nominal consolidated debt and the deficit as a percentage of GDP.
- 10) Mainly composed of transactions in other assets and liabilities (trade credits, other receivables/payables and financial derivatives).
- 11) Excluding financial derivatives.

Source: ECB calculations based on Eurostat and national data.

1) Revenue, expenditure and deficit/surplus are based on the ESA 95. Transactions between the EU budget and entities outside the government sector are not included. Otherwise, and except for different data transmission deadlines, the quarterly data are consistent with the annual data. The data are not seasonally adjusted.

2) The fiscal burden comprises taxes and social contributions.

6.5 Quarterly debt and change in debt

Source: ECB.

1) Data prior to July 2005 refer to the Romanian leu; 1 new Romanian leu is equivalent to 10,000 old Romanian lei.

2) For these currencies the ECB computes and publishes euro reference exchange rates as from 1 April 2005. Previous data are indicative.

3) Data prior to January 2005 refer to the Turkish lira; 1 new Turkish lira is equivalent to 1,000,000 old Turkish liras.

TECHNICAL NOTES

RELATING TO THE EURO AREA OVERVIEW

CALCULATION OF GROWTH RATES FOR MONETARY DEVELOPMENTS

The average growth rate for the quarter ending in month t is calculated as:

$$a) \left(\frac{0.5I_t + \sum_{i=1}^2 I_{t-i} + 0.5I_{t-3}}{0.5I_{t-12} + \sum_{i=1}^2 I_{t-i-12} + 0.5I_{t-15}} - 1 \right) \times 100$$

where I_t is the index of adjusted outstanding amounts as at month t (see also below). Likewise, for the year ending in month t , the average growth rate is calculated as:

$$b) \left(\frac{0.5I_t + \sum_{i=1}^{11} I_{t-i} + 0.5I_{t-12}}{0.5I_{t-12} + \sum_{i=1}^{11} I_{t-i-12} + 0.5I_{t-24}} - 1 \right) \times 100$$

RELATING TO SECTIONS 2.1 TO 2.6

CALCULATION OF TRANSACTIONS

Monthly transactions are calculated from monthly differences in outstanding amounts adjusted for reclassifications, other revaluations, exchange rate variations and any other changes which do not arise from transactions.

If L_t represents the outstanding amount at the end of month t , C_t^M the reclassification adjustment in month t , E_t^M the exchange rate adjustment and V_t^M the other revaluation adjustments, the transactions F_t^M in month t are defined as:

$$c) F_t^M = (L_t - L_{t-1}) - C_t^M - E_t^M - V_t^M$$

Similarly, the quarterly transactions F_t^Q for the quarter ending in month t are defined as:

$$d) F_t^Q = (L_t - L_{t-3}) - C_t^Q - E_t^Q - V_t^Q$$

where L_{t-3} is the amount outstanding at the end of month $t-3$ (the end of the previous quarter)

and, for example, C_t^Q is the reclassification adjustment in the quarter ending in month t .

For those quarterly series for which monthly observations are now available (see below), the quarterly transactions can be derived as the sum of the three monthly transactions in the quarter.

CALCULATION OF GROWTH RATES FOR MONTHLY SERIES

Growth rates may be calculated from transactions or from the index of adjusted outstanding amounts. If F_t^M and L_t are defined as above, the index I_t of adjusted outstanding amounts in month t is defined as:

$$e) I_t = I_{t-1} \times \left(1 + \frac{F_t^M}{L_{t-1}} \right)$$

The base of the index (of the non-seasonally adjusted series) is currently set as December 2001 = 100. Time series of the index of adjusted outstanding amounts are available on the ECB's website (www.ecb.int) under the "Money, banking and financial markets" sub-section of the "Statistics" section.

The annual growth rate a_t for month t – i.e. the change in the 12 months ending in month t – may be calculated using either of the following two formulae:

$$f) a_t = \left[\prod_{i=0}^{11} \left(1 + \frac{F_{t-i}^M}{L_{t-i-1}} \right) - 1 \right] \times 100$$

$$g) a_t = \left(\frac{I_t}{I_{t-12}} - 1 \right) \times 100$$

Unless otherwise indicated, the annual growth rates refer to the end of the indicated period. For example, the annual percentage change for the year 2002 is calculated in g) by dividing the index of December 2002 by the index of December 2001.

Growth rates for intra-annual periods may be derived by adapting formula g). For example, the month-on-month growth rate a_t^M may be calculated as:

$$h) a_t^M = \left(\frac{I_t}{I_{t-1}} - 1 \right) \times 100$$

Finally, the three-month moving average (centred) for the annual growth rate of M3 is obtained as $(a_{t+1} + a_t + a_{t-1})/3$, where a_t is defined as in f) or g) above.

CALCULATION OF GROWTH RATES FOR QUARTERLY SERIES

If F_t^Q and L_{t-3} are defined as above, the index I_t of adjusted outstanding amounts for the quarter ending in month t is defined as:

$$i) I_t = I_{t-3} \times \left(1 + \frac{F_t^Q}{L_{t-3}} \right)$$

The annual growth rate in the four quarters ending in month t , i.e. a_t , may be calculated using formula g).

SEASONAL ADJUSTMENT OF THE EURO AREA MONETARY STATISTICS¹

The approach used relies on a multiplicative decomposition through X-12-ARIMA.² The seasonal adjustment may include a day-of-the-week adjustment, and for some series is carried out indirectly by means of a linear combination of components. In particular, this is the case for M3, derived by aggregating the seasonally adjusted series for M1, M2 less M1, and M3 less M2.

The seasonal adjustment procedures are first applied to the index of adjusted outstanding amounts.³ The resulting estimates of the seasonal factors are then applied to the levels and to the adjustments arising from reclassifications and revaluations, in turn yielding seasonally adjusted transactions.

Seasonal (and trading day) factors are revised at annual intervals or as required.

RELATING TO SECTIONS 3.1 TO 3.3

CALCULATION OF GROWTH RATES

Growth rates are calculated on the basis of financial transactions and therefore exclude reclassifications, revaluations, exchange rate variations and any other changes which do not arise from transactions.

If T_t represents the transactions in quarter t and L_t represents the outstanding amount at the end of quarter t , then the growth rate for the quarter t is calculated as:

$$j) \frac{\sum_{i=0}^3 T_{t-i}}{L_{t-4}} \times 100$$

RELATING TO SECTION 4.3 AND 4.4

CALCULATION OF GROWTH RATES FOR DEBT SECURITIES AND QUOTED SHARES

Growth rates are calculated on the basis of financial transactions and therefore exclude reclassifications, revaluations, exchange rate variations and any other changes which do not arise from transactions. They may be calculated from transactions or from the index of notional stocks. If N_t^M represents the transactions (net

¹ For details, see "Seasonal adjustment of monetary aggregates and HICP for the euro area", ECB (August 2000) and the "Statistics" section of the ECB's website (www.ecb.int), under the "Money, banking and financial markets" sub-section.

² For details, see Findley, D., Monsell, B., Bell, W., Otto, M., and Chen, B. C. (1998), "New Capabilities and Methods of the X-12-ARIMA Seasonal Adjustment Program", *Journal of Business and Economic Statistics*, 16, 2, pp.127-152, or "X-12-ARIMA Reference Manual", Time Series Staff, Bureau of the Census, Washington, D.C.

For internal purposes, the model-based approach of TRAMO-SEATS is also used. For details on TRAMO-SEATS, see Gomez, V. and Maravall, A. (1996), "Programs TRAMO and SEATS: Instructions for the User", Banco de España, Working Paper No. 9628, Madrid.

³ It follows that for the seasonally adjusted series, the level of the index for the base period, i.e. December 2001, generally differs from 100, reflecting the seasonality of that month.

issues) in month t and L_t the level outstanding at the end of the month t , the index I_t of notional stocks in month t is defined as:

$$k) \quad I_t = I_{t-1} \times \left(1 + \frac{N_t}{L_{t-1}} \right)$$

As a base, the index is set equal to 100 on December 2001. The growth rate a_t for month t corresponding to the change in the 12 months ending in month t , may be calculated using either of the following two formulae:

$$l) \quad a_t = \left[\prod_{i=0}^{11} \left(1 + \frac{N_{t-i}^M}{L_{t-1-i}} \right) - 1 \right] \times 100$$

$$m) \quad a_t = \left(\frac{I_t}{I_{t-12}} - 1 \right) \times 100$$

The method used to calculate the growth rates for securities other than shares is the same as that used for the monetary aggregates, the only difference being that an “N” is used rather than an “F”. The reason for this is to distinguish between the different ways of obtaining “net issues” for securities issues statistics and the equivalent “transactions” calculated used for the monetary aggregates.

The average growth rate for the quarter ending in month t is calculated as:

$$n) \quad \left(\frac{0.5I_t + \sum_{i=1}^2 I_{t-i} + 0.5I_{t-3}}{0.5I_{t-12} + \sum_{i=1}^2 I_{t-12+i} + 0.5I_{t-15}} - 1 \right) \times 100$$

where I_t is the index of notional stocks as at month t . Likewise, for the year ending in month t , the average growth rate is calculated as:

$$o) \quad \left(\frac{0.5I_t + \sum_{i=1}^{11} I_{t-i} + 0.5I_{t-12}}{0.5I_{t-12} + \sum_{i=1}^{11} I_{t-12+i} + 0.5I_{t-24}} - 1 \right) \times 100$$

The calculation formula used for Section 4.3 is also used for Section 4.4 and is likewise based on that used for the monetary aggregates. Section 4.4 is based on market values and the basis for the calculation are financial transactions, which exclude reclassifications, revaluations or any other changes that do not arise from transactions. Exchange rate variations are not included as all quoted shares covered are denominated in euro.

SEASONAL ADJUSTMENT OF SECURITIES ISSUES STATISTICS⁴

The approach used relies on a multiplicative decomposition through X-12-ARIMA. The seasonal adjustment for the securities issues total is carried out indirectly by means of a linear combination of sector and maturity component breakdowns.

The seasonal adjustment procedures are applied to the index of notional stocks. The resulting estimates of the seasonal factors are then applied to the outstanding amounts, from which seasonally adjusted net issues are derived. Seasonal factors are revised at annual intervals or as required.

Similar as depicted in formula l) and m), the growth rate a_t for month t corresponding to the change in the 6 months ending in month t , may be calculated using either of the following two formulae:

$$p) \quad a_t = \left[\prod_{i=0}^5 \left(1 + \frac{N_{t-i}^M}{L_{t-1-i}} \right) - 1 \right] \times 100$$

$$q) \quad a_t = \left(\frac{I_t}{I_{t-6}} - 1 \right) \times 100$$

⁴ For details, see “Seasonal adjustment of monetary aggregates and HICP for the euro area”, ECB (August 2000) and the “Statistics” section of the ECB’s website (www.ecb.int), under the “Money, banking and financial markets” sub-section.

RELATING TO TABLE 1 IN SECTION 5.1

SEASONAL ADJUSTMENT OF THE HICP⁴

The approach used relies on multiplicative decomposition through X-12-ARIMA (see footnote 2 on page S74). The seasonal adjustment of the overall HICP for the euro area is carried out indirectly by aggregating the seasonally adjusted euro area series for processed food, unprocessed food, industrial goods excluding energy, and services. Energy is added without adjustment since there is no statistical evidence of seasonality. Seasonal factors are revised at annual intervals or as required.

RELATING TO TABLE 2 IN SECTION 7.1

SEASONAL ADJUSTMENT OF THE BALANCE OF PAYMENTS CURRENT ACCOUNT

The approach relies on multiplicative decomposition through X-12-ARIMA (see footnote 2 on page S74). The raw data for goods, services, income and current transfers are pre-adjusted to take a working-day effect into account. For goods, services and income, the working-day adjustment is corrected for national public holidays. Data on goods credits are also pre-adjusted for Easter. The seasonal adjustment for these items is carried out using these pre-adjusted series. The seasonal adjustment of the total current account is carried out by aggregating the seasonally adjusted euro area series for goods, services, income and current transfers. Seasonal (and trading day) factors are revised at semi-annual intervals or as required.

GENERAL NOTES

The “Euro area statistics” section of the Monthly Bulletin focuses on statistics for the euro area as a whole. More detailed and longer runs of data, with further explanatory notes, are available in the “Statistics” section of the ECB’s website (www.ecb.int). Services available under the “Data services” sub-section include a browser interface with search facilities, subscription to different datasets and a facility for downloading data directly as compressed Comma Separated Value (CSV) files. For further information, please contact us at: statistics@ecb.int.

In general, the cut-off date for the statistics included in the Monthly Bulletin is the day preceding the first meeting in the month of the Governing Council. For this issue, the cut-off date was 4 October 2006.

All data relate to the Euro 12, unless otherwise indicated. For the monetary data, the Harmonised Index of Consumer Prices (HICP), investment fund and financial market statistics, the statistical series relating to the euro area cover the EU Member States that had adopted the euro at the time to which the statistics relate. Where applicable, this is shown in the tables by means of a footnote; in the charts, the break is indicated by a dotted line. In these cases, where underlying data are available, absolute and percentage changes for 2001, calculated from a base in 2000, use a series which takes into account the impact of Greece’s entry into the euro area.

Given that the composition of the ECU does not coincide with the former currencies of the countries which have adopted the single currency, pre-1999 amounts converted from the participating currencies into ECU at current ECU exchange rates are affected by movements in the currencies of EU Member States which have not adopted the euro. To avoid this effect on the monetary statistics, the pre-1999 data in Sections 2.1 to 2.8 are expressed in units converted from national currencies at the irrevocable euro exchange rates established on 31 December 1998. Unless otherwise indicated,

price and cost statistics before 1999 are based on data expressed in national currency terms.

Methods of aggregation and/or consolidation (including cross-country consolidation) have been used where appropriate.

Recent data are often provisional and may be revised. Discrepancies between totals and their components may arise from rounding.

The group “Other EU Member States” comprises the Czech Republic, Denmark, Estonia, Cyprus, Latvia, Lithuania, Hungary, Malta, Poland, Slovenia, Slovakia, Sweden and United Kingdom.

In most cases, the terminology used within the tables follows international standards, such as those contained in the European System of Accounts 1995 (ESA 95) and the IMF Balance of Payments Manual. Transactions refer to voluntary exchanges (measured directly or derived), while flows also encompass changes in outstanding amounts owing to price and exchange rate changes, write-offs, and other changes.

In the tables, the term “up to (x) years” means “up to *and including* (x) years”.

OVERVIEW

Developments in key indicators for the euro area are summarised in an overview table.

MONETARY POLICY STATISTICS

Section 1.4 shows statistics on minimum reserve and liquidity factors. Annual and quarterly observations refer to averages of the last reserve maintenance period of the year/quarter. Until December 2003, the maintenance periods started on the 24th calendar day of a month and ran to the 23rd of the following month. On 23 January 2003 the ECB announced changes to the operational

framework, which were implemented on 10 March 2004. As a result of these changes, maintenance periods start on the settlement day of the main refinancing operation (MRO) following the Governing Council meeting at which the monthly assessment of the monetary policy stance is scheduled. A transitional maintenance period was defined to cover the period from 24 January to 9 March 2004.

Table 1 in Section 1.4 shows the components of the reserve base of credit institutions subject to reserve requirements. The liabilities vis-à-vis other credit institutions subject to the ESCB's minimum reserve system, the ECB and participating national central banks are excluded from the reserve base. When a credit institution cannot provide evidence of the amount of its issues of debt securities with a maturity of up to two years held by the institutions mentioned above, it may deduct a certain percentage of these liabilities from its reserve base. The percentage for calculating the reserve base was 10% until November 1999 and 30% thereafter.

Table 2 in Section 1.4 contains average data for completed maintenance periods. The amount of the reserve requirement of each individual credit institution is first calculated by applying the reserve ratio for the corresponding categories of liabilities to the eligible liabilities, using the balance sheet data from the end of each calendar month. Subsequently, each credit institution deducts from this figure a lump-sum allowance of €100,000. The resulting required reserves are then aggregated at the euro area level (column 1). The current account holdings (column 2) are the aggregate average daily current account holdings of credit institutions, including those that serve the fulfilment of reserve requirements. The excess reserves (column 3) are the average current account holdings over the maintenance period in excess of the required reserves. The deficiencies (column 4) are defined as the average shortfalls of current account holdings from required reserves over the maintenance period, computed

on the basis of those credit institutions that have not fulfilled their reserve requirement. The interest rate on minimum reserves (column 5) is equal to the average, over the maintenance period, of the ECB's rate (weighted according to the number of calendar days) on the Eurosystem's main refinancing operations (see Section 1.3).

Table 3 in Section 1.4 shows the banking system's liquidity position, which is defined as the current account holdings in euro of credit institutions in the euro area with the Eurosystem. All amounts are derived from the consolidated financial statement of the Eurosystem. The other liquidity-absorbing operations (column 7) exclude the issuance of debt certificates initiated by national central banks in Stage Two of EMU. The net other factors (column 10) represent the netted remaining items in the consolidated financial statement of the Eurosystem. The credit institutions' current accounts (column 11) are equal to the difference between the sum of liquidity-providing factors (columns 1 to 5) and the sum of liquidity-absorbing factors (columns 6 to 10). The base money (column 12) is calculated as the sum of the deposit facility (column 6), the banknotes in circulation (column 8) and the credit institutions' current account holdings (column 11).

MONEY, BANKING AND INVESTMENT FUNDS

Section 2.1 shows the aggregated balance sheet of the monetary financial institution (MFI) sector, i.e. the sum of the harmonised balance sheets of all MFIs resident in the euro area. MFIs are central banks, credit institutions as defined under Community law, money market funds and other institutions whose business it is to receive deposits and/or close substitutes for deposits from entities other than MFIs and, for their own account (at least in economic terms), to grant credits and/or make investments in securities. A complete list of MFIs is published on the ECB's website.

Section 2.2 shows the consolidated balance sheet of the MFI sector, which is obtained by netting the aggregated balance sheet positions between MFIs in the euro area. Due to limited heterogeneity in recording practices, the sum of the inter-MFI positions is not necessarily zero; the balance is shown in column 10 of the liabilities side of Section 2.2. Section 2.3 sets out the euro area monetary aggregates and counterparts. These are derived from the consolidated MFI balance sheet, and include positions of non-MFIs resident in the euro area held with MFIs resident in the euro area; they also take account of some monetary assets/liabilities of central government. Statistics on monetary aggregates and counterparts are adjusted for seasonal and trading-day effects. The external liabilities item of Sections 2.1 and 2.2 shows the holdings by non-euro area residents of i) shares/units issued by money market funds located in the euro area and ii) debt securities issued with a maturity of up to two years by MFIs located in the euro area. In Section 2.3, however, these holdings are excluded from the monetary aggregates and contribute to the item “net external assets”.

Section 2.4 provides an analysis by sector, type and original maturity of loans granted by MFIs other than the Eurosystem (the banking system) resident in the euro area. Section 2.5 shows a sectoral and instrument analysis of deposits held with the euro area banking system. Section 2.6 shows the securities held by the euro area banking system, by type of issuer.

Sections 2.2 to 2.6 include transactions, which are derived as differences in outstanding amounts adjusted for reclassifications, revaluations, exchange rate variations and any other changes which do not arise from transactions. Section 2.7 shows selected revaluations which are used in the derivation of transactions. Sections 2.2 to 2.6 also provide growth rates in terms of annual percentage changes based on the transactions. Section 2.8 shows a quarterly currency breakdown of selected MFI balance sheet items.

Details of the sector definitions are set out in the “Money and Banking Statistics Sector Manual – Guidance for the statistical classification of customers” (ECB, November 1999). The “Guidance Notes to the Regulation ECB/2001/13 on the MFI Balance Sheet Statistics” (ECB, November 2002) explains practices recommended to be followed by the NCBs. Since 1 January 1999 the statistical information has been collected and compiled on the basis of Regulation ECB/1998/16 of 1 December 1998 concerning the consolidated balance sheet of the Monetary Financial Institutions sector¹, as last amended by Regulation ECB/2003/10².

In line with this Regulation, the balance sheet item “money market paper” has been merged with the item “debt securities” on both the assets and liabilities side of the MFI balance sheet.

Section 2.9 shows end-of-quarter outstanding amounts for the balance sheet of the euro area investment funds (other than money market funds). The balance sheet is aggregated and therefore includes, among the liabilities, holdings by investment funds of shares/units issued by other investment funds. Total assets/liabilities are also broken down by investment policy (equity funds, bond funds, mixed funds, real estate funds and other funds) and by type of investor (general public funds and special investors’ funds). Section 2.10 shows the aggregated balance sheet for each investment fund sector as identified by investment policy and type of investor.

FINANCIAL AND NON-FINANCIAL ACCOUNTS

Sections 3.1 and 3.2 show quarterly data on financial accounts for non-financial sectors in the euro area, comprising general government (S.13 in the ESA 95), non-financial

¹ OJL 356, 30.12.1998, p. 7.

² OJL 250, 2.10.2003, p. 19.

corporations (S.11 in the ESA 95), and households (S.14 in the ESA 95) including non-profit institutions serving households (S.15 in the ESA 95). The data cover non-seasonally adjusted amounts outstanding and financial transactions classified according to the ESA 95 and show the main financial investment and financing activities of the non-financial sectors. On the financing side (liabilities), the data are presented by ESA 95 sector and original maturity (“short-term” refers to an original maturity of up to one year; “long-term” refers to an original maturity of over one year). Whenever possible, the financing taken from MFIs is presented separately. The information on financial investment (assets) is currently less detailed than that on financing, especially since a breakdown by sector is not possible.

Section 3.3 shows quarterly data on financial accounts for insurance corporations and pension funds (S.125 in the ESA 95) in the euro area. As in Sections 3.1 and 3.2, the data cover non-seasonally adjusted amounts outstanding and financial transactions, and show the main financial investment and financing activities of this sector.

The quarterly data in these three sections are based on quarterly national financial accounts data and MFI balance sheet and securities issues statistics. Sections 3.1 and 3.2 also refer to data taken from the BIS international banking statistics.

Section 3.4 shows annual data on saving, investment (financial and non-financial) and financing for the euro area as a whole, and separately for non-financial corporations and households. These annual data provide, in particular, fuller sectoral information on the acquisition of financial assets and are consistent with the quarterly data in the two previous sections.

FINANCIAL MARKETS

The series on financial market statistics for the euro area cover the EU Member States that had adopted the euro at the time to which the statistics relate.

Statistics on securities other than shares and quoted shares (Sections 4.1 to 4.4) are produced by the ECB using data from the ESCB and the BIS. Section 4.5 presents MFI interest rates on euro-denominated deposits and loans by euro area residents. Statistics on money market interest rates, long-term government bond yields and stock market indices (Sections 4.6 to 4.8) are produced by the ECB using data from wire services.

Statistics on securities issues cover securities other than shares (debt securities), which are presented in Sections 4.1, 4.2 and 4.3, and quoted shares, which are presented in Section 4.4. Debt securities are broken down into short-term and long-term securities. “Short-term” means securities with an original maturity of one year or less (in exceptional cases two years or less). Securities with a longer maturity, or with optional maturity dates, the latest of which is more than one year away, or with indefinite maturity dates, are classified as “long-term”. Long-term debt securities issued by euro area residents are further broken down into fixed and variable rate issues. Fixed rate issues consist of issues where the coupon rate does not change during the life of the issues. Variable rate issues include all issues where the coupon is periodically refixed by reference to an independent interest rate or index. The statistics on debt securities are estimated to cover approximately 95% of total issues by euro area residents. Euro-denominated securities indicated in Sections 4.1, 4.2 and 4.3 also include items expressed in national denominations of the euro.

Section 4.1 shows securities other than shares, by original maturity, residency of the issuer and currency. The section presents outstanding amounts, gross issues and net issues of

securities other than shares denominated in euro and securities other than shares issued by euro area residents in euro and in all currencies for total and long-term debt securities. Net issues differ from the changes in outstanding amounts owing to valuation changes, reclassifications and other adjustments. This section also presents seasonally adjusted statistics including annualised six-month seasonally adjusted growth rates for total and long-term debt securities. The latter are calculated from the seasonally adjusted index of notional stocks from which the seasonal effects have been removed. See the Technical notes for details.

Section 4.2 contains a sectoral breakdown of outstanding amounts, gross issues and net issues for issuers resident in the euro area in line with the ESA 95. The ECB is included in the Eurosystem.

The total outstanding amounts for total and long-term debt securities in column 1 of table 1 in Section 4.2, corresponds to the data on outstanding amounts for total and long-term debt securities issued by euro area residents in column 7 of Section 4.1. The outstanding amounts for total and long-term debt securities issued by MFIs in column 2 of table 1, Section 4.2 are broadly comparable with data for debt securities issued as shown on the liabilities side of the aggregated MFI balance sheet in column 8 of table 2, Section 2.1. The total net issues for total debt securities in column 1 of table 2 in Section 4.2 correspond to the data on total net issues by euro area residents in column 9 of Section 4.1. The residual difference between long-term debt securities and total fixed and variable rate long-term debt securities in table 1, Section 4.2 consists of zero coupon bonds and revaluation effects.

Section 4.3 shows non-seasonally and seasonally adjusted growth rates for debt securities issued by euro area residents (broken down by maturity, type of instrument, sector of the issuer and currency), which are based on financial transactions that occur when an

institutional unit incurs or redeems liabilities. The growth rates therefore exclude reclassifications, revaluations, exchange rate variations and any other changes which do not arise from transactions. The seasonally adjusted growth rates have been annualised for presentational purposes. See the Technical notes for details.

Section 4.4, columns 1, 4, 6 and 8, show the outstanding amounts of quoted shares issued by euro area residents broken down by issuing sector. The monthly data for quoted shares issued by non-financial corporations correspond to the quarterly series shown in Section 3.2 (main liabilities, column 21).

Section 4.4, columns 3, 5, 7 and 9, show annual growth rates for quoted shares issued by euro area residents (broken down by the sector of the issuer), which are based on financial transactions that occur when an issuer sells or redeems shares for cash excluding investments in the issuer's own shares. Transactions include the quotation of an issuer on a stock exchange for the first time and the creation or deletion of new instruments. The calculation of annual growth rates excludes reclassifications, revaluations and any other changes which do not arise from transactions.

Section 4.5 presents statistics on all the interest rates that MFIs resident in the euro area apply to euro-denominated deposits and loans vis-à-vis households and non-financial corporations resident in the euro area. Euro area MFI interest rates are calculated as a weighted average (by corresponding business volume) of the euro area countries' interest rates for each category.

MFI interest rate statistics are broken down by type of business coverage, sector, instrument category and maturity, period of notice or initial period of interest rate fixation. The new MFI interest rate statistics replace the ten transitional statistical series on euro area retail interest rates that have been published in the ECB's Monthly Bulletin since January 1999.

Section 4.6 presents money market interest rates for the euro area, the United States and Japan. For the euro area, a broad spectrum of money market interest rates is covered spanning from interest rates on overnight deposits to those on twelve-month deposits. Before January 1999 synthetic euro area interest rates were calculated on the basis of national rates weighted by GDP. With the exception of the overnight rate to December 1998, monthly, quarterly and yearly values are period averages. Overnight deposits are represented by interbank deposit bid rates up to December 1998. From January 1999 column 1 of Section 4.6 shows the euro overnight index average (EONIA). These are end-of-period rates up to December 1998 and period averages thereafter. From January 1999 interest rates on one-, three-, six- and twelve-month deposits are euro interbank offered rates (EURIBOR); until December 1998, London interbank offered rates (LIBOR) where available. For the United States and Japan, interest rates on three-month deposits are represented by LIBOR.

Section 4.7 presents government bond yields for the euro area, the United States and Japan. Until December 1998, two-, three-, five- and seven-year euro area yields were end-of-period values and ten-year yields period averages. Thereafter, all yields are period averages. Until December 1998, euro area yields were calculated on the basis of harmonised national government bond yields weighted by GDP; thereafter, the weights are the nominal outstanding amounts of government bonds in each maturity band. For the United States and Japan, ten-year yields are period averages.

Section 4.8 shows stock market indices for the euro area, the United States and Japan.

PRICES, OUTPUT, DEMAND AND LABOUR MARKETS

Most of the data described in this section are produced by the European Commission (mainly Eurostat) and national statistical authorities.

Euro area results are obtained by aggregating data for individual countries. As far as possible, the data are harmonised and comparable. Statistics on hourly labour costs, GDP and expenditure components, value added by economic activity, industrial production, retail sales and passenger car registrations are adjusted for the variations in the number of working days.

The Harmonised Index of Consumer Prices (HICP) for the euro area (Section 5.1) is available from 1995 onwards. It is based on national HICPs, which follow the same methodology in all euro area countries. The breakdown by goods and services components is derived from the Classification of individual consumption by purpose (Coicop/HICP). The HICP covers monetary expenditure on final consumption by households on the economic territory of the euro area. The table includes seasonally adjusted HICP data which are compiled by the ECB.

Industrial producer prices (Table 2 in Section 5.1), industrial production, industrial new orders, industrial turnover and retail sales (Section 5.2) are covered by Council Regulation (EC) No 1165/98 of 19 May 1998 concerning short-term statistics³. The breakdown by end-use of products for industrial producer prices and industrial production is the harmonised sub-division of industry excluding construction (NACE sections C to E) into Main Industrial Groupings (MIGs) as defined by Commission Regulation (EC) No 586/2001 of 26 March 2001⁴. Industrial producer prices reflect the ex-factory gate prices of producers. They include indirect taxes except VAT and other deductible taxes. Industrial production reflects the value added of the industries concerned.

World market prices of raw materials (Table 2 in Section 5.1) measures price changes of euro-denominated euro area imports compared with the base period.

3 OJ L 162, 5.6.1998, p. 1.

4 OJ L 86, 27.3.2001, p. 11.

The labour cost indices (Table 3 in Section 5.1) measure the changes in labour costs per hour worked in industry (including construction) and market services. Their methodology is laid down in Regulation (EC) No 450/2003 of the European Parliament and of the Council of 27 February 2003 concerning the labour cost index⁵ and in the implementing Commission Regulation (EC) No 1216/2003 of 7 July 2003⁶. A breakdown of hourly labour costs for the euro area is available by labour cost component (wages and salaries, and employers' social contributions plus employment-related taxes paid by the employer less subsidies received by the employer) and by economic activity. The ECB calculates the indicator of negotiated wages (memo item in Table 3 of Section 5.1) on the basis of non-harmonised, national-definition data.

Unit labour cost components (Table 4 in Section 5.1), GDP and its components (Tables 1 and 2 in Section 5.2), GDP deflators (Table 5 in Section 5.1) and employment statistics (Table 1 in Section 5.3) are results of the ESA 95 quarterly national accounts.

Industrial new orders (Table 4 in Section 5.2) measure the orders received during the reference period and cover industries working mainly on the basis of orders – in particular textile, pulp and paper, chemical, metal, capital goods and durable consumer goods industries. The data are calculated on the basis of current prices.

Indices for turnover in industry and for the retail trade (Table 4 in Section 5.2) measure the turnover, including all duties and taxes with the exception of VAT, invoiced during the reference period. Retail trade turnover covers all retail trade excluding sales of motor vehicles and motorcycles, and except repairs. New passenger car registrations covers registrations of both private and commercial passenger cars.

Qualitative business and consumer survey data (Table 5 in Section 5.2) draw on the European Commission Business and Consumer Surveys.

Unemployment rates (Table 2 in Section 5.3) conform to International Labour Organisation (ILO) guidelines. They refer to persons actively seeking work as a share of the labour force, using harmonised criteria and definitions. The labour force estimates underlying the unemployment rate are different from the sum of the employment and unemployment levels published in Section 5.3.

GOVERNMENT FINANCE

Sections 6.1 to 6.5 show the general government fiscal position in the euro area. The data are mainly consolidated and are based on the ESA 95 methodology. The annual euro area aggregates in Sections 6.1 to 6.3 are compiled by the ECB from harmonised data provided by the NCBs, which are regularly updated. The deficit and debt data for the euro area countries may therefore differ from those used by the European Commission within the excessive deficit procedure. The quarterly euro area aggregates in Sections 6.4 and 6.5 are compiled by the ECB on the basis of Eurostat and national data.

Section 6.1 presents annual figures on general government revenue and expenditure on the basis of definitions laid down in Commission Regulation (EC) No 1500/2000 of 10 July 2000⁷ amending the ESA 95. Section 6.2 shows details of general government gross consolidated debt at nominal value in line with the Treaty provisions on the excessive deficit procedure. Sections 6.1 and 6.2 include summary data for the individual euro area countries owing to their importance in the framework of the Stability and Growth Pact. The deficits/surpluses presented for the individual euro area countries correspond to EDP B.9 as defined by Commission Regulation (EC) No 351/2002 of 25 February 2002

5 OJL 69, 13.3.2003, p. 1.

6 OJL 169, 8.7.2003, p. 37.

7 OJL 172, 12.7.2000, p. 3.

amending Council Regulation (EC) No 3605/93 as regards references to the ESA 95. Section 6.3 presents changes in general government debt. The difference between the change in the government debt and the government deficit – the deficit-debt adjustment – is mainly explained by government transactions in financial assets and by foreign exchange valuation effects. Section 6.4 presents quarterly figures on general government revenue and expenditure on the basis of definitions laid down in the Regulation (EC) No 1221/2002 of the European Parliament and of the Council of 10 June 2002⁸ on quarterly non-financial accounts for general government. Section 6.5 presents quarterly figures on gross consolidated government debt, the deficit-debt adjustment and the government borrowing requirement. These figures are compiled using data provided by the Member States under Regulations (EC) No 501/2004 and 1222/2004 and data provided by the National Central Banks.

EXTERNAL TRANSACTIONS AND POSITIONS

The concepts and definitions used in balance of payments (b.o.p.) and international investment position (i.i.p.) statistics (Sections 7.1 to 7.4) are generally in line with the IMF Balance of Payments Manual (fifth edition, October 1993), the ECB Guideline of 16 July 2004 on the statistical reporting requirements of the ECB (ECB/2004/15)⁹, and Eurostat documents. Additional references about the methodologies and sources used in the euro area b.o.p. and i.i.p. statistics can be found in the ECB publication entitled “European Union balance of payments/international investment position statistical methods” (November 2005), and in the following task force reports: “Portfolio investment collection systems” (June 2002), “Portfolio investment income” (August 2003) and “Foreign direct investment” (March 2004), which can be downloaded from the ECB’s website. In addition, the report of the ECB/Commission (Eurostat) Task Force on Quality of balance of payments and international

investment position statistics (June 2004) is available on the website of the Committee on Monetary, Financial and Balance of Payments Statistics (www.cmfb.org). The annual quality report on the euro area b.o.p./i.i.p., which is based on the Task Force’s recommendations, is available on the ECB’s website.

The presentation of net transactions in the financial account follows the sign convention of the IMF Balance of Payments Manual: an increase of assets appears with a minus sign, while an increase of liabilities appears with a plus sign. In the current account and capital account, both credit and debit transactions are presented with a plus sign.

The euro area b.o.p. is compiled by the ECB. The recent monthly figures should be regarded as provisional. Data are revised when figures for the following month and/or the detailed quarterly b.o.p. are published. Earlier data are revised periodically or as a result of methodological changes in the compilation of the source data.

In Section 7.1, Table 2 contains seasonally adjusted data for the current account. Where appropriate, the adjustment covers also working-day, leap year and/or Easter effects. Table 5 provides a sectoral breakdown of euro area purchasers of securities issued by non-residents of the euro area. It is not yet possible to show a sectoral breakdown of euro area issuers of securities acquired by non-residents. In Tables 6 and 7 the breakdown between “loans” and “currency and deposits” is based on the sector of the non-resident counterpart, i.e. assets vis-à-vis non-resident banks are classified as deposits, whereas assets vis-à-vis other non-resident sectors are classified as loans. This breakdown follows the distinction made in other statistics, such as the MFI consolidated balance sheet, and conforms to the IMF Balance of Payments Manual.

⁸ OJ L 179, 9.7.2002, p. 1.

⁹ OJ L 354, 30.11.2004, p. 34.

Section 7.2 contains a monetary presentation of the b.o.p.: the b.o.p. transactions mirroring the transactions in the external counterpart of M3. The data follow the sign conventions of the b.o.p., except for the transactions in the external counterpart of M3 taken from money and banking statistics (column 12), where a positive sign denotes an increase of assets or a decrease of liabilities. In portfolio investment liabilities (columns 5 and 6), the b.o.p. transactions include sales and purchases of equity and debt securities issued by MFIs in the euro area, apart from shares of money market funds and debt securities with a maturity of up to two years. A methodological note on the monetary presentation of the euro area b.o.p. is available in the “Statistics” section of the ECB’s website. See also Box 1 in the June 2003 issue of the Monthly Bulletin.

Section 7.3 presents a geographical breakdown of the euro area b.o.p. (Tables 1 to 4) and i.i.p. (Table 5) vis-à-vis main partner countries individually or as a group, distinguishing between EU Member States outside the euro area and countries or areas outside the European Union. The breakdown also shows transactions and positions vis-à-vis EU institutions (which, apart from the ECB, are treated statistically as outside the euro area, regardless of their physical location) and for some purposes also offshore centres and international organisations. Tables 1 to 4 show cumulative b.o.p. transactions in the latest four quarters; Table 5 shows a geographical breakdown of the i.i.p. for the latest end-year. The breakdown does not cover transactions or positions in portfolio investment liabilities, financial derivatives and international reserves. The geographical breakdown is described in the article entitled “Euro area balance of payments and international investment position vis-à-vis main counterparts” in the February 2005 issue of the Monthly Bulletin.

The data on the euro area i.i.p. in Section 7.4 are based on positions vis-à-vis non-residents of the euro area, considering the euro area as a single economic entity (see also Box 9 in the

December 2002 issue of the Monthly Bulletin). The i.i.p. is valued at current market prices, with the exception of direct investment, where book values are used to a large extent. The quarterly i.i.p. is compiled on the basis of the same methodological framework as the annual i.i.p. As some data sources are not available on a quarterly basis (or are available with a delay), the quarterly i.i.p. is partly estimated on the basis of financial transactions and asset prices and foreign exchange developments.

The outstanding amounts of the Eurosystem’s international reserves and related assets and liabilities are shown in Section 7.4, Table 5, together with the part held by the ECB. These figures are not fully comparable with those of the Eurosystem’s weekly financial statement owing to differences in coverage and valuation. The data in Table 5 are in line with the recommendations for the IMF/BIS template on international reserves and foreign currency liquidity. Changes in the gold holdings of the Eurosystem (column 3) are due to transactions in gold within the terms of the Central Bank Gold Agreement of 26 September 1999, updated on 8 March 2004. More information on the statistical treatment of the Eurosystem’s international reserves can be found in a publication entitled “Statistical treatment of the Eurosystem’s international reserves” (October 2000), which can be downloaded from the ECB’s website. The website also contains more comprehensive data in accordance with the template on international reserves and foreign currency liquidity.

Section 7.5 shows data on euro area external trade in goods. The main source is Eurostat. The ECB derives volume indices from Eurostat value and unit value indices, and performs seasonal adjustment of unit value indices, while value data are seasonally and working-day adjusted by Eurostat.

The breakdown by product group in columns 4 to 6 and 9 to 11 of Table 1 in Section 7.5 is in line with the classification by Broad Economic Categories. Manufactured goods (columns 7

and 12) and oil (column 13) are in line with the SITC Rev. 3 definition. The geographical breakdown (Table 2 in Section 7.5) shows main trading partners individually or in regional groups. Mainland China excludes Hong Kong.

Owing to differences in definitions, classification, coverage and time of recording, external trade data, in particular for imports, are not fully comparable with the goods item in the balance of payments statistics (Sections 7.1 to 7.3). The difference for imports has been around 5% in recent years (ECB estimate), a significant part of which relates to the inclusion of insurance and freight services in the external trade data (c.i.f. basis).

EXCHANGE RATES

Section 8.1 shows nominal and real effective exchange rate (EER) indices for the euro calculated by the ECB on the basis of weighted averages of bilateral exchange rates of the euro against the currencies of the euro area's trading partners. A positive change denotes an appreciation of the euro. Weights are based on trade in manufactured goods with the trading partners in the periods 1995-1997 and 1999-2001, and are calculated to account for third-market effects. The EER indices result from the linking at the beginning of 1999 of the indices based on 1995-1997 weights to those based on 1999-2001 weights. The EER-23 group of trading partners is composed of the 13 non-euro area EU Member States, Australia, Canada, China, Hong Kong, Japan, Norway, Singapore, South Korea, Switzerland and the United States. The EER-42 group includes, in addition to the EER-23, the following countries: Algeria, Argentina, Brazil, Bulgaria, Croatia, India, Indonesia, Israel, Malaysia, Mexico, Morocco, New Zealand, the Philippines, Romania, Russia, South Africa, Taiwan, Thailand and Turkey. Real EERs are calculated using consumer price indices, producer price indices, gross domestic product deflators, unit labour costs in manufacturing and unit labour costs in the total economy.

For more detailed information on the calculation of the EERs, see Box 10 entitled "Update of the overall trade weights for the effective exchange rates of the euro and computation of a new set of euro indicators" in the September 2004 issue of the Monthly Bulletin and the ECB's Occasional Paper No 2 ("The effective exchange rates of the euro" by Luca Buldorini, Stelios Makrydakis and Christian Thimann, February 2002), which can be downloaded from the ECB's website.

The bilateral rates shown in Section 8.2 are monthly averages of those published daily as reference rates for these currencies.

DEVELOPMENTS OUTSIDE THE EURO AREA

Statistics on other EU Member States (Section 9.1) follow the same principles as those for data relating to the euro area. Data for the United States and Japan contained in Section 9.2 are obtained from national sources.

ANNEXES

CHRONOLOGY OF MONETARY POLICY MEASURES OF THE EUROSYSTEM¹

8 JANUARY 2004

The Governing Council of the ECB decides that the minimum bid rate on the main refinancing operations and the interest rates on the marginal lending facility and the deposit facility will remain unchanged at 2.0%, 3.0% and 1.0% respectively.

12 JANUARY 2004

The Governing Council of the ECB decides to increase the allotment amount for each of the longer-term refinancing operations to be conducted in the year 2004 from €15 billion to €25 billion. This increased amount takes into consideration the higher liquidity needs of the euro area banking system anticipated for the year 2004. The Eurosystem will, however, continue to provide the bulk of liquidity through its main refinancing operations. The Governing Council may decide to adjust the allotment amount again at the beginning of 2005.

5 FEBRUARY, 4 MARCH 2004

The Governing Council of the ECB decides that the minimum bid rate on the main refinancing operations and the interest rates on the marginal lending facility and the deposit facility will remain unchanged at 2.0%, 3.0% and 1.0% respectively.

10 MARCH 2004

In accordance with the Governing Council's decision of 23 January 2003, the maturity of the Eurosystem's main refinancing operations is reduced from two weeks to one week and the maintenance period for the Eurosystem's required reserve system is redefined to start on the settlement day of the main refinancing operation following the Governing Council meeting at which the monthly assessment of the monetary policy

stance is pre-scheduled, rather than on the 24th day of the month.

1 APRIL, 6 MAY, 3 JUNE, 1 JULY, 5 AUGUST, 2 SEPTEMBER, 7 OCTOBER, 4 NOVEMBER, 2 DECEMBER 2004 AND 13 JANUARY 2005

The Governing Council of the ECB decides that the minimum bid rate on the main refinancing operations and the interest rates on the marginal lending facility and the deposit facility will remain unchanged at 2.0%, 3.0% and 1.0% respectively.

14 JANUARY 2005

The Governing Council of the ECB decides to increase the allotment amount for each of the longer-term refinancing operations to be conducted in the year 2005 from €25 billion to €30 billion. This increased amount takes into consideration the higher liquidity needs of the euro area banking system anticipated in 2005. The Eurosystem will however continue to provide the bulk of liquidity through its main refinancing operations. The Governing Council may decide to adjust the allotment amount again at the beginning of 2006.

3 FEBRUARY, 3 MARCH, 7 APRIL, 4 MAY, 2 JUNE, 7 JULY, 4 AUGUST, 1 SEPTEMBER, 6 OCTOBER AND 3 NOVEMBER 2005

The Governing Council of the ECB decides that the minimum bid rate on the main refinancing operations and the interest rates on the marginal lending facility and the deposit facility will

¹ The chronology of monetary policy measures of the Eurosystem taken between 1999 and 2003 can be found on pages 176 to 180 of the ECB's Annual report 1999, on pages 205 to 208 of the ECB's Annual report 2000, on pages 219 to 220 of the ECB's Annual Report 2001, on pages 234 to 235 of the ECB's Annual Report 2002 and on pages 217 to 218 of the ECB's Annual Report 2003 respectively.

remain unchanged at 2.0%, 3.0% and 1.0% respectively.

1 DECEMBER 2005

The Governing Council of the ECB decides to increase the minimum bid rate on the main refinancing operations by 0.25 percentage point to 2.25%, starting from the operation to be settled on 6 December 2005. In addition, it decides to increase the interest rates on both the marginal lending facility and the deposit facility by 0.25 percentage point, to 3.25% and 1.25% respectively, both with effect from 6 December 2005.

16 DECEMBER 2005

The Governing Council of the ECB decides to increase the allotment amount for each of the longer-term refinancing operations to be conducted in the year 2006 from €30 billion to €40 billion. This increased amount takes two aspects into consideration. First, the liquidity needs of the euro area banking system are expected to increase further in the year 2006. Second, the Eurosystem has decided to increase slightly the share of the liquidity needs satisfied by the longer-term refinancing operations. The Eurosystem will, however, continue to provide the bulk of liquidity through its main refinancing operations. The Governing Council may decide to adjust the allotment amount again at the beginning of 2007.

12 JANUARY AND 2 FEBRUARY 2006

The Governing Council of the ECB decides that the minimum bid rate on the main refinancing operations and the interest rates on the marginal lending facility and the deposit facility will remain unchanged at 2.25%, 3.25% and 1.25% respectively.

2 MARCH 2006

The Governing Council of the ECB decides to increase the minimum bid rate on the main refinancing operations by 25 basis points to 2.50%, starting from the operation to be settled on 8 March 2006. In addition, it decides to increase the interest rates on both the marginal lending facility and the deposit facility by 25 basis points, to 3.50% and 1.50% respectively, both with effect from 8 March 2006.

6 APRIL AND 4 MAY 2006

The Governing Council of the ECB decides that the minimum bid rate on the main refinancing operations and the interest rates on the marginal lending facility and the deposit facility will remain unchanged at 2.50%, 3.50% and 1.50% respectively.

8 JUNE 2006

The Governing Council of the ECB decides to increase the minimum bid rate on the main refinancing operations by 25 basis points to 2.75%, starting from the operation to be settled on 15 June 2006. In addition, it decides to increase the interest rates on both the marginal lending facility and the deposit facility by 25 basis points, to 3.75% and 1.75% respectively, both with effect from 15 June 2006.

6 JULY 2006

The Governing Council of the ECB decides that the minimum bid rate on the main refinancing operations and the interest rates on the marginal lending facility and the deposit facility will remain unchanged at 2.75%, 3.75% and 1.75% respectively.

3 AUGUST 2006

The Governing Council of the ECB decides to increase the minimum bid rate on the main refinancing operations by 25 basis points to 3.0%, starting from the operation to be settled on 9 August 2006. In addition, it decides to increase the interest rates on both the marginal lending facility and the deposit facility by 25 basis points, to 4.0% and 2.0%, both with effect from 9 August 2006.

31 AUGUST 2006

The Governing Council of the ECB decides that the minimum bid rate on the main refinancing operations and the interest rates on the marginal lending facility and the deposit facility will remain unchanged at 3.0%, 4.0% and 2.0% respectively.

5 OCTOBER 2006

The Governing Council of the ECB decides to increase the minimum bid rate on the main refinancing operations by 25 basis points to 3.25%, starting from the operation to be settled on 11 October 2006. In addition, it decides to increase the interest rates on both the marginal lending facility and the deposit facility by 25 basis points, to 4.25% and 2.25%, both with effect from 11 October 2006.

DOCUMENTS PUBLISHED BY THE EUROPEAN CENTRAL BANK SINCE 2005

This list is designed to inform readers about selected documents published by the European Central Bank since January 2005. For Working Papers, the list only refers to publications released between July and September 2006. Unless otherwise indicated, hard copies can be obtained or subscribed to free of charge, stock permitting, by contacting info@ecb.int.

For a complete list of documents published by the European Central Bank and by the European Monetary Institute, please visit the ECB's website (<http://www.ecb.int>).

ANNUAL REPORT

"Annual Report 2004", April 2005.

"Annual Report 2005", April 2006.

CONVERGENCE REPORT

"Convergence Report May 2006".

MONTHLY BULLETIN ARTICLES

"The new Basel Capital Accord: main features and implications", January 2005.

"Financial flows to emerging market economies: changing patterns and recent developments", January 2005.

"Bank market discipline", February 2005.

"Initial experience with the changes to the Eurosystem's operational framework for monetary policy implementation", February 2005.

"Euro area balance of payments and international investment position vis-à-vis main counterparts", February 2005.

"Asset price bubbles and monetary policy", April 2005.

"Comparability of statistics for the euro area, the United States and Japan", April 2005.

"The ESCB-CESR standards for securities clearing and settlement in the European Union", April 2005.

"Monetary policy and inflation differentials in a heterogeneous currency area", May 2005.

"Consolidation and diversification in the euro area banking sector", May 2005.

"The evolving framework for corporate governance", May 2005.

"The Harmonised Index of Consumer Prices: concept, properties and experience to date", July 2005.

"The Lisbon strategy – five years on", July 2005.

"The use of harmonised MFI interest rate statistics", July 2005.

"The reform of the Stability and Growth Pact", August 2005.

"The role of 'Emerging Asia' in the global economy", August 2005.

"The euro banknotes: developments and future challenges", August 2005.

"Money demand and uncertainty", October 2005.

"Assessing the performance of financial systems", October 2005.

"Price-setting behaviour in the euro area", November 2005.

"Developments in corporate finance in the euro area", November 2005.

"Economic and financial relations between the euro area and Russia", November 2005.

"The predictability of the ECB's monetary policy", January 2006.

"Hedge funds: developments and policy implications", January 2006.

"Assessing house price developments in the euro area", February 2006.

"Fiscal policies and financial markets", February 2006.

“The importance of public expenditure reform for economic growth and stability”, April 2006.
“Portfolio management at the ECB”, April 2006.
“Monetary and exchange rate arrangements of the euro area with selected third countries and territories”, April 2006.
“The contribution of the ECB and the Eurosystem to European financial integration”, May 2006.
“The single list in the collateral framework of the Eurosystem”, May 2006.
“Equity issuance in the euro area”, May 2006.
“Measures of inflation expectations in the euro area”, July 2006.
“Competitiveness and the export performance of the euro area”, July 2006.
“Sectoral money holding: determinants and recent developments”, August 2006.
“The evolution of large-value payment systems in the euro area”, August 2006.
“Demographic change in the euro area: projections and consequences”, October 2006.
“Integrated financial and non-financial accounts for the institutional sectors in the euro area”, October 2006.

STATISTICS POCKET BOOK

Available monthly since August 2003.

LEGAL WORKING PAPER SERIES

- 1 “The developing EU legal framework for clearing and settlement of financial instruments” by K. M. Löber, February 2006.
- 2 “The application of multilingualism in the European Union context” by P. Athanassiou, March 2006.

OCCASIONAL PAPER SERIES

- 22 “Assessing potential output growth in the euro area – a growth accounting perspective” by A. Musso and T. Westermann, January 2005.
- 23 “The bank lending survey for the euro area” by J. Berg, A. Van Rixtel, A. Ferrando, G. de Bondt and S. Scopel, February 2005.
- 24 “Wage diversity in the euro area – an overview of labour cost differentials across industries” by V. Genre, D. Momferatou and G. Mourre, February 2005.
- 25 “Government debt management in the euro area: recent theoretical developments and changes in practices” by G. Wolswijk and J. de Haan, March 2005.
- 26 “Analysing banking sector conditions: how to use macro-prudential indicators” by L. Mörttinen, P. Poloni, P. Sandars and J. Vesala, April 2005.
- 27 “The EU budget: how much scope for institutional reform?” by H. Enderlein, J. Lindner, O. Calvo-Gonzalez and R. Ritter, April 2005.
- 28 “Regulatory reforms in selected EU network industries” by R. Martin, M. Roma and I. Vansteenkiste, April 2005.
- 29 “Wealth and asset price effects on economic activity” by F. Altissimo, E. Georgiou, T. Sastre, M. T. Valderrama, G. Sterne, M. Stocker, M. Weth, K. Whelan, A. Willman, June 2005.
- 30 “Competitiveness and the export performance of the euro area” by a task force of the Monetary Policy Committee of the European System of Central Banks, June 2005.
- 31 “Regional monetary integration in the member states of the Gulf Cooperation Council” by M. Sturm and N. Siegfried, June 2005.
- 32 “Managing financial crises in emerging market economies – experience with the involvement of private sector creditors” by an International Relations Committee Task Force, June 2005.

- 33 “Integration of securities market infrastructures in the euro area” by H. Schmiedel and A. Schönenberger, July 2005.
- 34 “Hedge funds and their implications for financial stability” by T. Garbaravicius and F. Dierick, August 2005.
- 35 “The institutional framework for financial market policy in the USA seen from an EU perspective” by R. Petschnigg, September 2005.
- 36 “Economic and monetary integration of the new Member States: helping to chart the route” by I. Angeloni, M. Flad and F. P. Mongelli, September 2005.
- 37 “Financing conditions in the euro area” by L. Bê Duc, G. de Bondt, A. Calza, D. Marqués Ibáñez, A. van Rixtel and S. Scopel, October 2005.
- 38 “Economic reactions to public finance consolidation: a survey of the literature” by M. G. Briotti, October 2005.
- 39 “Labour productivity in the Nordic EU countries: a comparative overview and explanatory factors 1980-2004” by A. Annenkov and C. Madaschi, October 2005.
- 40 “What does European institutional integration tell us about trade integration?” by F. P. Mongelli, E. Dorrucchi and I. Agur, December 2005.
- 41 “Trends and patterns in working time across euro area countries 1970-2004: causes and consequences” by N. Leiner-Killinger, C. Madaschi and M. Ward-Warmedinger, December 2005.
- 42 “The New Basel Capital Framework and its implementation in the European Union” by F. Dierick, F. Pires, M. Scheicher and K. G. Spitzer, December 2005.
- 43 “The accumulation of foreign reserves” by an International Relations Committee Task Force, February 2006.
- 44 “Competition, productivity and prices in the euro area services sector” by a task force of the Monetary Policy Committee of the European System of Central Banks, April 2006.
- 45 “Output growth differentials across the euro area countries: some stylised facts” by N. Benalal, J. L. Diaz del Hoyo, B. Pierluigi and N. Vidalis, May 2006.
- 46 “Inflation persistence and price-setting behaviour in the euro area – a summary of the IPN evidence” by F. Altissimo, M. Ehrmann and F. Smets, June 2006.
- 47 “The reform and implementation of the Stability and Growth Pact” by R. Morris, H. Ongena and L. Schuknecht, June 2006.
- 48 “Macroeconomic and financial stability challenges for acceding and candidate countries” by the International Relations Committee Task Force on Enlargement, July 2006.
- 49 “Credit risk mitigation in central bank operations and its effects on financial markets: the case of the Eurosystem” by U. Bindseil and F. Papadia, August 2006.
- 50 “Implications for liquidity from innovation and transparency in the European corporate bond market” by M. Laganà, M. Peřina, I. von Köppen-Mertes and A. Persaud, August 2006.
- 51 “Macroeconomic implications of demographic developments in the euro area” by A. Maddaloni, A. Musso, P. Rother, M. Ward-Warmedinger and T. Westermann, August 2006.

WORKING PAPER SERIES

- 651 “On the determinants of external imbalances and net international portfolio flows: a global perspective” by R. A. De Santis and M. Lührmann, July 2006.
- 652 “Consumer price adjustment under the microscope: Germany in a period of low inflation” by J. Hoffmann and J.-R. Kurz-Kim, July 2006.
- 653 “Acquisition versus greenfield: the impact of the mode of foreign bank entry on information and bank lending rates” by S. Claey's and C. Hainz, July 2006.
- 654 “The German block of the ESCB multi-country model” by I. Vetlov and T. Warmedinger, July 2006.

- 655 “Fiscal and monetary policy in the enlarged European Union” by S. Pogorelec, July 2006.
- 656 “Public debt and long-term interest rates: the case of Germany, Italy and the United States” by P. Paesani, R. Strauch and M. Kremer, July 2006.
- 657 “The impact of ECB monetary policy decisions and communication on the yield curve” by C. Brand, D. Buncic and J. Turunen, July 2006.
- 658 “The response of firms’ investment and financing to adverse cash flow shocks: the role of bank relationships” by C. Fuss and P. Vermeulen, July 2006.
- 659 “Monetary policy rules in the pre-EMU era: is there a common rule?” by M. Eleftheriou, D. Gerdesmeier and B. Roffia, July 2006.
- 660 “The Italian block of the ESCB multi-country model” by E. Angelini, A. D’Agostino and P. McAdam, July 2006.
- 661 “Fiscal policy in a monetary economy with capital and finite lifetime” by B. Annicchiarico, N. Giammarioli and A. Piergallini, July 2006.
- 662 “Cross-border bank contagion in Europe” by R. Gropp, M. Lo Duca and J. Vesala, July 2006.
- 663 “Monetary conservatism and fiscal policy” by K. Adam and R. M. Billi, July 2006.
- 664 “Fiscal convergence before entering EMU” by L. Onorante, July 2006.
- 665 “The euro as invoicing currency in international trade” by A. Kamps, August 2006.
- 666 “Quantifying the impact of structural reforms” by E. Ernst, G. Gong, W. Semmler and L. Bukeviciute, August 2006.
- 667 “The behaviour of the real exchange rate: evidence from regression quantiles” by K. Nikolaou, August 2006.
- 668 “Declining valuations and equilibrium bidding in central bank refinancing operations” by C. Ewerhart, N. Cassola and N. Valla, August 2006.
- 669 “Regular adjustment: theory and evidence” by J. D. Konieczny and F. Rumler, August 2006.
- 670 “The importance of being mature: the effect of demographic maturation on global per-capita GDP” by R. Gómez and P. Hernández de Cos, August 2006.
- 671 “Business cycle synchronisation in East Asia” by F. Moneta and R. Ruffer, August 2006.
- 672 “Understanding inflation persistence: a comparison of different models” by H. Dixon and E. Kara, September 2006.
- 673 “Optimal monetary policy in the generalised Taylor economy” by E. Kara, September 2006.
- 674 “A quasi-maximum likelihood approach for large approximate dynamic factor models” by C. Doz, D. Giannone and L. Reichlin, September 2006.
- 675 “Expansionary fiscal consolidations in Europe: new evidence” by A. Afonso, September 2006.
- 676 “The distribution of contract durations across firms: a unified framework for understanding and comparing dynamic wage and price-setting models” by H. Dixon, September 2006.
- 677 “What drives EU banks’ stock returns? Bank-level evidence using the dynamic dividend-discount model” by O. Castren, T. Fitzpatrick and M. Sydow, September 2006.
- 678 “The geography of international portfolio flows, international CAPM and the role of monetary policy frameworks” by R. A. De Santis, September 2006.
- 679 “Monetary policy in the media” by H. Berger, M. Ehrmann and M. Fratzscher, September 2006.

GLOSSARY

This glossary contains selected items that are frequently used in the Monthly Bulletin. A more comprehensive and detailed glossary can be found on the ECB's website (www.ecb.int/home/glossary/html/index.en.html).

Autonomous liquidity factors: liquidity factors that do not normally stem from the use of monetary policy instruments. Such factors are, for example, banknotes in circulation, government deposits with the central bank and the net foreign assets of the central bank.

Bank lending survey (BLS): a quarterly survey on lending policies that has been conducted by the Eurosystem since January 2003. It addresses qualitative questions on developments in credit standards, terms and conditions of loans and loan demand for both enterprises and households to a predefined sample group of banks in the euro area.

Borrowing requirement (general government): net incurrence of debt by general government.

Central parity (or central rate): the exchange rate of each ERM II member currency vis-à-vis the euro, around which the ERM II fluctuation margins are defined.

Compensation per employee: the total remuneration, in cash or in kind, that is payable by employers to employees, i.e. gross wages and salaries, as well as bonuses, overtime payments and employers' social security contributions, divided by the total number of employees.

Consolidated balance sheet of the MFI sector: a balance sheet obtained by netting out inter-MFI positions (e.g. inter-MFI loans and deposits) in the aggregated MFI balance sheet. It provides statistical information on the MFI sector's assets and liabilities vis-à-vis residents of the euro area not belonging to this sector (i.e. general government and other euro area residents) and vis-à-vis non-euro area residents. It is the main statistical source for the calculation of monetary aggregates, and it provides the basis for the regular analysis of the counterparts of M3.

Debt (financial accounts): loans, deposit liabilities, debt securities issued and pension fund reserves of non-financial corporations (resulting from employers' direct pension commitments on behalf of their employees), valued at market value at the end of the period. However, due to data limitations, the debt given in the quarterly financial accounts does not include loans granted by non-financial sectors (e.g. inter-company loans) or by banks outside the euro area, whereas these components are included in the annual financial accounts.

Debt (general government): the gross debt (deposits, loans and debt securities excluding financial derivatives) at nominal value outstanding at the end of the year and consolidated between and within the sectors of general government.

Debt security: a promise on the part of the issuer (i.e. the borrower) to make one or more payment(s) to the holder (the lender) at a specified future date or dates. Such securities usually carry a specific rate of interest (the coupon) and/or are sold at a discount to the amount that will be repaid at maturity. Debt securities issued with an original maturity of more than one year are classified as long-term.

Debt-to-GDP ratio (general government): the ratio of general government debt to GDP at current market prices. It is the subject of one of the fiscal criteria laid down in Article 104 (2) of the Treaty establishing the European Community to define the existence of an excessive deficit.

Deficit (general government): the general government's net borrowing, i.e. the difference between total government revenue and total government expenditure.

Deficit-debt adjustment (general government): the difference between the general government deficit and the change in general government debt.

Deficit ratio (general government): the ratio of the general government deficit to GDP at current market prices. It is the subject of one of the fiscal criteria laid down in Article 104 (2) of the Treaty establishing the European Community to define the existence of an excessive deficit. It is also referred to as the budget deficit ratio or the fiscal deficit ratio.

Deflation: a decline in the general price level, e.g. in the consumer price index.

Deposit facility: a standing facility of the Eurosystem which counterparties may use to make overnight deposits, remunerated at a pre-specified interest rate, at a national central bank.

Direct investment: cross-border investment for the purpose of obtaining a lasting interest in an enterprise resident in another economy (assumed, in practice, for ownership of at least 10% of the ordinary shares or voting power). Included are equity capital, reinvested earnings and other capital associated with inter-company operations. The direct investment account records net transactions/positions in assets abroad by euro area residents (as "direct investment abroad") and net transactions/positions in euro area assets by non-residents (as "direct investment in the euro area").

Effective exchange rates (EERs) of the euro (nominal/real): weighted averages of bilateral euro exchange rates against the currencies of the euro area's main trading partners. The ECB publishes nominal EER indices for the euro against two groups of trading partners: the EER-23 (comprising the 13 non-euro area EU Member States and the 10 main trading partners outside the EU) and the EER-42 (composed of the EER-23 and 19 additional countries). The weights used reflect the share of each partner country in euro area trade and account for competition in third markets. Real EERs are nominal EERs deflated by a weighted average of foreign, relative to domestic, prices or costs. They are thus measures of price and cost competitiveness.

EONIA (euro overnight index average): a measure of the effective interest rate prevailing in the euro interbank overnight market. It is calculated as a weighted average of the interest rates on unsecured overnight lending transactions denominated in euro, as reported by a panel of contributing banks.

Equities: securities representing ownership of a stake in a corporation. They comprise shares traded on stock exchanges (quoted shares), unquoted shares and other forms of equity. Equities usually produce income in the form of dividends.

ERM II (exchange rate mechanism II): the exchange rate arrangement that provides the framework for exchange rate policy cooperation between the euro area countries and the EU Member States not participating in Stage Three of EMU.

EURIBOR (euro interbank offered rate): the rate at which a prime bank is willing to lend funds in euro to another prime bank, computed daily for interbank deposits with different maturities of up to 12 months.

Euro area: the area formed by those EU Member States in which the euro has been adopted as the single currency in accordance with the Treaty.

European Commission surveys: harmonised surveys of business and/or consumer sentiment conducted on behalf of the European Commission in each of the EU Member States. Such questionnaire-based surveys are addressed to managers in the manufacturing, construction, retail and services industries, as well as to consumers. From each monthly survey, composite indicators are calculated that summarise the replies to a number of different questions in a single indicator (confidence indicators).

Eurosystem: the central banking system made up of the European Central Bank and the national central banks of those EU Member States that have already adopted the euro.

Eurozone Purchasing Managers' Surveys: surveys of business conditions in manufacturing and in services industries conducted for a number of countries in the euro area and used to compile indices. The Eurozone Manufacturing Purchasing Managers' Index (PMI) is a weighted indicator calculated from indices of output, new orders, employment, suppliers' delivery times and stocks of purchases. The services sector survey asks questions on business activity, expectations of future business activity, the amount of business outstanding, incoming new business, employment, input prices and prices charged. The Eurozone Composite Index is calculated by combining the results from the manufacturing and services sector surveys.

External trade in goods: exports and imports of goods with countries outside the euro area, measured in terms of value and as indices of volume and unit value. External trade statistics are not comparable with the exports and imports recorded in the national accounts, as the latter include both intra-euro area and extra-euro area transactions, and also combine goods and services. Nor are they fully comparable with the goods item in b.o.p. statistics. Besides methodological adjustments, the main difference is to be found in the fact that imports in external trade statistics are recorded including insurance and freight services, whereas they are recorded free on board in the goods item in the b.o.p. statistics.

Fixed rate tender: a tender procedure in which the interest rate is specified in advance by the central bank and in which participating counterparties bid the amount of money they wish to transact at the fixed interest rate.

General government: a sector defined in the ESA 95 as comprising resident entities that are engaged primarily in the production of non-market goods and services intended for individual and collective consumption and/or in the redistribution of national income and wealth. Included are central, regional and local government authorities as well as social security funds. Excluded are government-owned entities that conduct commercial operations, such as public enterprises.

Gross domestic product (GDP): the value of an economy's total output of goods and services less intermediate consumption, plus net taxes on products and imports. GDP can be broken down by output, expenditure or income components. The main expenditure aggregates that make up GDP are household final consumption, government final consumption, gross fixed capital

formation, changes in inventories, and imports and exports of goods and services (including intra-euro area trade).

Harmonised Index of Consumer Prices (HICP): a measure of consumer prices that is compiled by Eurostat and harmonised for all EU Member States.

Hourly labour cost index: a measure of labour costs, including gross wages and salaries (in cash and in kind, including bonuses) and other labour costs (employers' social contributions plus employment-related taxes paid by the employer minus subsidies received by the employer), per hour actually worked (including overtime).

Implied volatility: the expected volatility (i.e. standard deviation) in the rates of change of the price of an asset (e.g. a share or a bond). It can be derived from the asset's price, maturity date and exercise price of its options, as well as from a riskless rate of return, using an option pricing model such as the Black-Scholes model.

Index of negotiated wages: a measure of the direct outcome of collective bargaining in terms of basic pay (i.e. excluding bonuses) at the euro area level. It refers to the implied average change in monthly wages and salaries.

Industrial producer prices: factory-gate prices (transportation costs are not included) of all products sold by industry excluding construction on the domestic markets of the euro area countries, excluding imports.

Industrial production: the gross value added created by industry at constant prices.

Inflation: an increase in the general price level, e.g. in the consumer price index.

Inflation-indexed government bonds: debt securities issued by the general government, the coupon payments and principal of which are linked to a specific consumer price index.

International reserves: external assets readily available to and controlled by monetary authorities for directly financing or regulating the magnitude of payments imbalances through intervention in exchange markets. The international reserves of the euro area comprise non-euro denominated claims on non-euro area residents, gold, special drawing rights (SDRs) and the reserve positions in the IMF which are held by the Eurosystem.

International investment position (i.i.p.): the value and composition of an economy's outstanding net financial claims on (or financial liabilities to) the rest of the world.

Job vacancies: a collective term covering newly created jobs, unoccupied jobs or jobs about to become vacant in the near future, for which the employer has taken recent active steps to find a suitable candidate.

Key ECB interest rates: the interest rates, set by the Governing Council, which reflect the monetary policy stance of the ECB. They are the minimum bid rate on the main refinancing operations, the interest rate on the marginal lending facility and the interest rate on the deposit facility.

Labour force: the sum total of persons in employment and the number of unemployed.

Labour productivity: the output that can be produced with a given input of labour. It can be measured in several ways, but is commonly measured as GDP at constant prices divided by either total employment or total hours worked.

Longer-term refinancing operation: a regular open market operation executed by the Eurosystem in the form of reverse transactions. Such operations are carried out through a monthly standard tender and normally have a maturity of three months.

M1: a narrow monetary aggregate that comprises currency in circulation plus overnight deposits held with MFIs and central government (e.g. at the post office or treasury).

M2: an intermediate monetary aggregate that comprises M1 plus deposits redeemable at a period of notice of up to and including three months (i.e. short-term savings deposits) and deposits with an agreed maturity of up to and including two years (i.e. short-term time deposits) held with MFIs and central government.

M3: a broad monetary aggregate that comprises M2 plus marketable instruments, in particular repurchase agreements, money market fund shares and units, and debt securities with a maturity of up to and including two years issued by MFIs.

Main refinancing operation: a regular open market operation executed by the Eurosystem in the form of reverse transactions. Such operations are carried out through a weekly standard tender and normally have a maturity of one week.

Marginal lending facility: a standing facility of the Eurosystem which counterparties may use to receive overnight credit from a national central bank at a pre-specified interest rate against eligible assets.

MFI credit to euro area residents: MFI loans granted to non-MFI euro area residents (including general government and the private sector) and MFI holdings of securities (shares, other equity and debt securities) issued by non-MFI euro area residents.

MFI interest rates: the interest rates that are applied by resident credit institutions and other MFIs, excluding central banks and money market funds, to euro-denominated deposits and loans vis-à-vis households and non-financial corporations resident in the euro area.

MFI longer-term financial liabilities: deposits with an agreed maturity of over two years, deposits redeemable at a period of notice of over three months, debt securities issued by euro area MFIs with an original maturity of more than two years and the capital and reserves of the euro area MFI sector.

MFI net external assets: the external assets of the euro area MFI sector (such as gold, foreign currency banknotes and coins, securities issued by non-euro area residents and loans granted to non-euro area residents) minus the external liabilities of the euro area MFI sector (such as non-euro area residents' deposits and repurchase agreements, as well as their holdings of money market fund shares/units and debt securities issued by MFIs with a maturity of up to and including two years).

MFIs (monetary financial institutions): financial institutions which together form the money-issuing sector of the euro area. These include the Eurosystem, resident credit institutions (as defined in Community law) and all other resident financial institutions whose business is to receive deposits and/or close substitutes for deposits from entities other than MFIs and, for their own account (at least in economic terms), to grant credit and/or invest in securities. The latter group consists predominantly of money market funds.

Portfolio investment: euro area residents' net transactions and/or positions in securities issued by non-residents of the euro area ("assets") and non-residents' net transactions and/or positions in securities issued by euro area residents ("liabilities"). Included are equity securities and debt securities (bonds and notes, and money market instruments). Transactions are recorded at the effective price paid or received, less commissions and expenses. To be regarded as a portfolio asset, ownership in an enterprise must be equivalent to less than 10% of the ordinary shares or voting power.

Price stability: the maintenance of price stability is the primary objective of the Eurosystem. The Governing Council defines price stability as a year-on-year increase in the Harmonised Index of Consumer Prices (HICP) for the euro area of below 2%. The Governing Council has also made it clear that, in the pursuit of price stability, it aims to maintain inflation rates below, but close to, 2% over the medium term.

Reference value for M3 growth: the annual growth rate of M3 over the medium term that is consistent with the maintenance of price stability. At present, the reference value for annual M3 growth is 4½%.

Reserve requirement: the minimum amount of reserves a credit institution is required to hold with the Eurosystem. Compliance is determined on the basis of the average of the daily balances over a maintenance period of around one month.

Survey of Professional Forecasters (SPF): a quarterly survey that has been conducted by the ECB since 1999 to collect macroeconomic forecasts on euro area inflation, real GDP growth and unemployment from a panel of experts affiliated to financial and non-financial organisations based in the EU.

Unit labour costs: a measure of total labour costs per unit of output calculated for the euro area as the ratio of total compensation per employee to labour productivity (defined as GDP at constant prices per person employed).

Variable rate tender: a tender procedure where the counterparties bid both the amount of money they wish to transact with the central bank and the interest rate at which they wish to enter into the transaction.

Yield curve: a graphical representation of the relationship between the interest rate or yield and the maturity at a given point in time for debt securities with the same credit risk but different maturity dates. The slope of the yield curve can be measured as the difference between the interest rates at two selected maturities.
