

The modelfile of the Bank of Italy quarterly econometric model

Note: In actual projections, public finance developments are forecasted using a separate model (called public finance model), which is made to interact iteratively with the macroeconomic outlook derived within the quarterly econometric model. The public finance model, based on annual data, accounts in great detail of the different components of the public balance: for the revenue side, the developments of tax bases supplied by the macroeconomic model are used as input, together with estimated tax elasticities; for the expenditure side, the forecasts mainly hinge on price dynamics, yield curve, demographic changes and labour market developments. The forecasts of the public finance model also take into account the information contained in the Budget Law and the infra-annual development of Government cash data. The projections of the public finance model are then passed to the quarterly econometric model (forced to replicate those data on the basis of its equations) to obtain an updated projection of the macroeconomic outlook. This updated outlook is then fed into the public finance model and the process is iterated up to convergence.
