**Stata Examples**

December 2022

**Stata commands are lower-case. STATA is case-sensitive.**

### **Example:**

We estimate, for 2013, a linear model in which import/export is the dependent variable and the covariates are macro-area of residence and number of employees.

```
import delimited "dr_ttn.csv"
keep IMPORTO AREA_GEO CLA_ADDETTI ANNO if ANNO==2013
/* generating dummies for macro-area and class of employee number */
tabulate CLA_ADDETTI, gen(cla_addetti_d)
/* this creates 7 dummies for class of employee number */
tabulate AREA_GEO, gen(area_geo_d)
/* this creates 4 dummies for macro-area */
/* estimate the model omitting one dummy for each factor to be the benchmark class */
reg IMPORTO cla_addetti_d2-cla_addetti_d7 area_geo_d2-area_geo_d4
```
